Package ‘a4Preproc’

March 22, 2024

Type Package
Title Automated Affymetrix Array Analysis Preprocessing Package
Version 1.50.0
Date 2020-10-14
Description Utility functions to pre-process data for the Automated Affymetrix Array Analysis set of packages.
Imports BiocGenerics, Biobase
Suggests ALL, hgu95av2.db, knitr, rmarkdown
License GPL-3
biocViews Microarray, Preprocessing
RoxygenNote 7.1.1
VignetteBuilder knitr

**addGeneInfo**

*Utility Function to Add Annotation to existing ExpressionSet Objects*

**Description**

 Adds appropriate featureData, similar to the metadata added in the pipeline script, to the ExpressionSet object.

**Usage**

```r
addGeneInfo(eset, annotationLibrary = NULL)
```

**Arguments**

- `eset` ExpressionSet object for to which one wants to add additional annotation information
- `annotationLibrary` Annotation Library to use. Must be specified when working with Entrez gene IDs. In this case, one can make use of the JnJ annotation packages such as hgu133plus2hsentrezgJnJ. If not specified, the annotation of the package will be automatically requested with `annotation()` of the expressionSet object `eset` and then Affymetrix probe set IDs are expected in `featureNames`

**Details**

Slots of featureData(a4ALL) are

- Entrez ID~: Entrez ID as retrieved from annotation package
- Ensembl ID~: Ensembl ID as retrieved from annotation package
- Gene Symbol~: Gene symbol as retrieved from annotation package
- Description~: Description as retrieved from annotation package

**Value**

A new ExpressionSet object with the additional information stored as feature data

**Note**

One should always use subscripting of featureData by column name (e.g. `featureData(a4ALL)$`Entrez ID`); as the pipeline ExpressionSets have one additional column compared to the ExpressionSet objects produced by `addGeneInfo`, i.e. column 2 of the pipeline ExpressionSets corresponds to column one of an `addGeneInfo` ExpressionSet.

**Author(s)**

Tobias Verbeke, Steven Osselaer
Examples

library(ALL)
data(ALL)
a4ALL <- addGeneInfo(ALL)
head(featureData(a4ALL)$'Entrez ID')
