Package ‘categoryCompare’

April 3, 2024

Version 1.46.0
Title Meta-analysis of high-throughput experiments using feature annotations
Author Robert M. Flight <rflight79@gmail.com>
Maintainer Robert M. Flight <rflight79@gmail.com>
URL https://github.com/rmflight/categoryCompare
BugReports https://github.com/rmflight/categoryCompare/issues
License GPL-2
Depends R (>= 2.10), Biobase, BiocGenerics (>= 0.13.8),
Suggests knitr, GO.db, KEGGREST, estrogen, org.Hs.eg.db, hgu95av2.db, limma, affy, genefilter, rmarkdown
Imports AnnotationDbi, hwriter, GSEABase, Category (>= 2.33.1), GOstats, annotate, colorspace, graph, RCy3 (>= 1.99.29), methods, grDevices, utils
LazyLoad yes
Description Calculates significant annotations (categories) in each of two (or more) feature (i.e. gene) lists, determines the overlap between the annotations, and returns graphical and tabular data about the significant annotations and which combinations of feature lists the annotations were found to be significant. Interactive exploration is facilitated through the use of RCytoscape (heavily suggested).
SystemRequirements Cytoscape (>= 3.6.1) (if used for visualization of results, heavily suggested)
TODO Text and HTML output without graphs.

categoryCompare-package

Meta-analysis of high-throughput experiments using feature annotations

Description

Calculates significant annotations (categories) in each of two (or more) feature (i.e. gene) lists, determines the overlap between the annotations, and returns graphical and tabular data about the significant annotations and which combinations of feature lists the annotations were found to be significant. Interactive exploration is facilitated through the use of RCytoscape (heavily suggested).

Details

Package: categoryCompare
Version: 1.21.2
License: GPL-2
Depends: Biobase (>= 1.15.29), AnnotationDbi (>= 0.1.15), Category
Suggests: methods, GSEABase, hwriter, colorspace, graph, GO.db, KEGG.db, estrogen, org.Hs.eg.db, hgu95av2.db
Imports: Biobase (>= 1.15.29), AnnotationDbi (>= 0.1.15), hwriter, GSEABase, Category (>= 2.21.2), GOstats, annotate, colorspace, graph, RCy3
LazyLoad: yes
biocViews: Bioinformatics, Annotation, GO, MultipleComparisons, Pathways, GeneExpression
SystemRequirements: Cytoscape (>= 2.8.0) (if used for visualization of results, heavily suggested), CytoscapeRPC plugin (>= 1.8.2)
TODO: Text and HTML output without graphs.
Built: R 2.15.0; ; 2012-03-15 18:42:40 UTC; windows

ccCompare-methods

Description

Methods for function breakEdges in package categoryCompare

Methods

signature(cwObject = "ccCompareResult", cutoff = "numeric") Allows one to remove edges in the ccCompareResult mainGraph slot prior to passing it into Cytoscape for visualization. Given that the number of edges can be rather large (especially for Gene Ontology) this can easily speed up the transfer, without actually losing any information.

signature(cwObject = "numeric", cutoff = "numeric") Once an annotation graph is in Cytoscape, remove edges above or below the cutoff. Note that this does not affect the original graph in the ccCompareResult object.

Author(s)

Robert M Flight

breakEdges ccCompareResult ccOutCyt

Examples

data(ccData)

# breaking the edges in a ccCompareResult
ccResults$BP <- breakEdges(ccResults$BP, 0.8)
## Not run:
hasCy <- (if (.Platform$OS.type %in% "windows") {
(length(grep("Cytoscape", system("tasklist", intern=TRUE))) > 0))

if hasCy {
cwObj <- ccOutCyt(ccResults$BP, ccOpts)
# now breaking them in the CytoscapeWindow object
breakEdges(cwObj, 0.85)
Sys.sleep(10)
RCy3::deleteWindow(cwObj)
}

## End(Not run)

Comparisons of enriched annotations

Description

Takes the results from ccEnrich and compares the enriched annotations based on the settings previously set in ccOptions. Returns a ccCompareResult or ccCompareCollection object, see Details.
Usage

ccCompare(ccEnrichResult, ccOptions)

Arguments

ccEnrichResult  The enriched annotations collection returned from ccEnrich. This can be the ccEnrichCollection, GOccEnrichResult, or KEGGccEnrichResult
ccOptions  A ccOptions object that will determine which lists to actually compare against each other. See details below.

Details

Based on the enrichments found for each gene list, we now want to compare the annotations between lists. ccCompare accesses the annotations for each enrichment performed for each list, and makes the comparisons defined in ccOptions.

Value

ccCompare generates both a graph of the comparisons (to show how the categories are linked to each list and each other) and tabular output. The tabular output is a data frame, with ID for each term that was considered as a candidate annotation for each list, as well as a long description (Desc) of what the term is, and then membership and statistics from each gene list.

For each type of comparison (GO, KEGG, etc) a ccCompareResult is generated, with the following slots:

mainGraph  Annotations arranged as a graph
mainTable  The tabular results from all enrichment calculations combined into one
allAnnotation  A list of lists, where each entry is the annotation identifier, then a list for each comparison, with the genes that are annotated to that term that also belong to each list

The default is to generate an overlap graph for GO and KEGG, where the overlap is a measure of the similarity of the features (genes) annotated to each annotation term (based on a formula from EnrichmentMap). Optionally for GO, one can generate a hierarchical layout where the parent GO terms of the significant terms will also be included in the graph, with term origin saved in the node annotation (see example below to do this).

Only those terms with more than 10 and less than 500 annotated genes (according to the GO annotation file) are included.

When using weighted overlap graphs and RCy3 for viewing, it is recommended to use breakEdges and minNodes to remove edges with low weights and nodes with only a few genes from the dataset annotated to them.

### ccCompareCollection-class

**Class** "ccCompareCollection"

**Description**

Holds multiple ccCompareResult objects.

**Objects from the Class**

Objects can be created by calls of the form `new("ccCompareCollection", ...)`. These are not normally created by the user, but rather by `ccCompare` while performing the categorical comparisons for each type of category.

**Slots**

- `.Data`: Object of class "list"
- `names`: Object of class "character"

**Extends**

Methods

No methods defined with class "ccCompareCollection" in the signature.

ccCompareResult-class

Class "ccCompareResult"

Description

Holds the results from a single category comparison

Objects from the Class

Objects can be created by calls of the form new("ccCompareResult", ...).
ccData

Slots

mainGraph: Object of class "graph". Holds the graph describing the relationships between the annotations

subGraph: Object of class "list". Not currently used

mainTable: Object of class "data.frame". Table of results, with all the various statistics for each annotation in the category

allAnnotation: Object of class "list". For each annotation, which genes from which comparison are annotated to that particular annotation

categoryName: Object of class "character". Which category (e.g. GO, KEGG, etc) was used

ontology: Object of class "character". If GO, which ontology was used

Methods

allAnnotation signature(object = "ccCompareResult"): ...

mainGraph signature(object = "ccCompareResult"): ...

mainTable<- signature(object = "ccCompareResult"): ...

cpData Test data for categoryCompare

Description

Processed data from the estrogen example data set

Usage

data(ccData)
Perform annotation enrichment for multiple gene lists

Takes a `ccGeneList` object containing all the information needed to perform enrichment calculations for Gene Ontology.

Usage

```r
ccEnrich(ccGeneList)
```
Arguments

ccGeneList A ccGeneList object, which is really just a list of lists, with some extra slots to tell us how to examine results. Each entry in the list should be named to allow identification later on. Each sub list should contain a vector genes denoting the genes of interest, a vector universe denoting the gene background (i.e. all genes on the chip), and an entry annotation denoting an organism database package (such as org.Hs.eg.db). See ccGeneList for more details regarding this object.

Details

This function is essentially a wrapper for hyperGTestCC that performs all of the calculations for the many gene lists in one go, returning a list of HyperGResultCC objects, one for each of the ccTypes and each gene list. These various HyperGResultCC objects can then be accessed and results compared among the lists for each of the ontologies.

Value

A list of HyperGResultCC objects, one for each ccType and gene list, returned as ccEnrichResult objects for each ccType. This can be passed with a ccOptions object to ccCompare to generate actual annotation comparisons.

ccGeneList, hyperGTestCC, ccEnrichResult

Examples

```r
## Not run:
require(GO.db)
require(KEGG.db)
require(org.Hs.eg.db)

## End(Not run)
data(ccData)

g10 <- (unique(table10$Entrez[1:100]))
g48 <- (unique(table48$Entrez[1:100]))

list10 <- list(genes=g10, universe=gUniverse, annotation="org.Hs.eg.db")
list48 <- list(genes=g48, universe=gUniverse, annotation="org.Hs.eg.db")

geneLists <- list(T10=list10, T48=list48)
geneLists <- new("ccGeneList", geneLists, ccType=c("BP","KEGG"))
geneLists <- new("ccGeneList", geneLists, ccType=c("CC","KEGG"))

# set number of fdr runs to 0 to speed up runtime, not generally recommended.
```
```r
# Load necessary libraries
library(ccEnrich)

# Create gene lists
geneLists <- new("ccGeneList", geneLists, ccType = c('BP', 'KEGG'), pvalueCutoff=0.01, fdr=0)
# Enrich the gene lists
# enrichLists <- ccEnrich(geneLists)
```

---

**Description**

Holds multiple classes of `ccEnrichResult` in one object to allow `ccCompare` to work on only the one object and generate all of the results of a comparison.

**Objects from the Class**

Objects can be created by calls of the form `new("ccEnrichCollection", ...)`. 

**Slots**

- `.Data`: Object of class "list"
- `.names`: Object of class "character" The names (generally GO ontologies or KEGG, but can be changed) of each set of results

**Extends**

**Methods**

- `pvalueCutoff<-` signature(r = "ccEnrichCollection"): Changes the `pvalueCutoff` to be used to decide significant annotations for all of the contained `ccEnrichResult` objects
- `pvalueType<-` signature(object = "ccEnrichCollection"): Changes whether to use `p-values` or `fdr` values to determine those annotations that are significant in all of the contained `ccEnrichResult` objects
- `minCount<-` signature(object = "ccEnrichCollection"): how many features have to be annotated to a term to be reported as significant
- `graphType` signature(object = "ccEnrichCollection"): Gets the type of graph that should be output for this collection

**Author(s)**

Robert M Flight

**See Also**

`ccEnrich` `hyperGTestCC` `ccCompare` `ccEnrichResult`
Examples

```r
data(ccData)
enrichLists```

Description

Acts as a container object for multiple `HyperGResultCC` objects.

Objects from the Class

Objects can be created by calls of the form `new("ccEnrichResult", ...)`. 

Extends

Methods

- `fdr` signature(object = "ccEnrichResult"): get the number of runs using random feature lists were performed
- `pvalueCutoff` signature(r = "ccEnrichResult"): what is the pvalueCutoff to determine significant annotations
- `pvalueCutoff<-` signature(r = "ccEnrichResult"): change the pvalueCutoff for an annotation to be considered significant
- `pvalueType<-` signature(object = "ccEnrichResult"): change whether p-values used are from "FDR" or raw p-values
- `minCount` signature(object = "ccEnrichResult"): how many features need to belong to an annotation to be reported
- `minCount<-` signature(object = "ccEnrichResult"): adjust the minCount
- `graphType` signature(object = "ccEnrichResult"): what type of graph should be generated (generally set by the class of object)
- `graphType<-` signature(object = "ccEnrichResult"): change the type of graph to generate by `ccCompare`

Author(s)

Robert M Flight
Examples

data(ccData)
enrichRes <- enrichLists[[1]]
fdr(enrichRes)
pvalueType(enrichRes)
enrichRes
pvalueType(enrichRes) <- 'pval'
enrichRes

pvalueCutoff(enrichRes)
pvalueCutoff(enrichRes) <- 0.01
enrichRes

ccGeneList-class  

Description

This stores the actual gene lists and related information that will be used in categoryCompare.

Objects from the Class

Objects can be created by calls of the form new("ccGeneList", list)). ccGeneList is actually just an extension of R list objects. The input list should be a list of lists. See Details for more information.

Slots

  fdr: Object of class "numeric" The number of fdr runs to perform to account for different list sizes and term dependence
  pvalueCutoff: Object of class "numeric" Value used to determine whether or not a particular term is significant or not
  ccType: Object of class "character" What types of annotations to use. Currently supported ones include "BP", "MF", "CC" (from Gene Ontology) and "KEGG"
  testDirection: Object of class "character" Are you interested in "over" or "under" represented annotations

Methods

  fdr  signature(object = "ccGeneList"): how many random runs to perform
  fdr<- signature(object = "ccGeneList"): change the number of random runs
  pvalueCutoff signature(object = "ccGeneList"): what is the pvalue to consider significant
  pvalueCutoff<- signature(object = "ccGeneList"): change the cutoff for significance
  ccType signature(object = "ccGeneList"): what type of annotations are going to be examined
  ccType<- signature(object = "ccGeneList"): change the type of annotations to examine
**testDirection** signature(object = "ccGeneList"): query for "over" or "under" represented annotations

**testDirection** <- signature(object = "ccGeneList"): change the type of representation ("over" or "under")

**listNames** signature(object = "ccGeneList"): what are the names of the lists contained

**Details**

The input list should be a list of lists, with at least three sub-lists.

testList <- list(list1=list(genes='...',universe='...',annotation='...'), list2=list(...))

**genes**: These are the gene identifiers of the genes that are of interest (differentially expressed genes)

**universe**: All of the genes that were measured in this particular experiments (i.e. all the genes on the chip)

**annotation**: What organism or chip do these ID’s come from (e.g. "org.Hs.eg.db" for Human Entrez gene ID’s, "hgu133a.db" for probe ID’s from the Affymetrix U133A chip)

**data**: A data-frame that contains extra information about the genes of interest. At the very least, the data-frame must have a column ID that matches the ID’s contained in genes

What actually happens when running ccEnrich is that the appropriate HyperGParamsCC objects are generated for each geneList and each type of annotation (e.g. BP, CC, KEGG), and then the calculations performed on each one.

**Note**

The ccGeneList object is what will undergo all of the enrichment calculations. When the results are combined with the ccOptions object, we can get our results of actual comparisons between experiments.

list48 <- list(genes=g48, universe=gUniverse, annotation="org.Hs.eg.db")

geneLists <- list(T10=list10, T48=list48)
geneLists <- new("ccGeneList", geneLists, ccType=c("BP","KEGG"))
geneLists
Class "ccOptions"

Description

These objects store the various options required by categoryCompare for actually making comparisons and generating output.

Objects from the Class

Objects can be created by calls of the form `new("ccOptions", listNames=c('list1','list2',etc)). This is the minimum call required, and will generate a ccOptions object where comparisons are assumed between all the lists supplied. See the examples section for more examples of how to initialize new objects.

Slots

listNames: Object of class "character" The actual names of the various datasets defined in the ccData object

compareNames: Object of class "character" Which lists to compare, each entry should be a comma separated list

compareIndx: Object of class "list" List indices for each of the comparison, not usually set by the user. Generated automatically.

compareColors: Object of class "character" For graphical and tabular output each comparison can be colored. Should be one color for each comparison. Can be either an n by 3 matrix of rgb triples, or a character vector of hexadecimal color codes, or character vector of color names ('red','green','blue', etc)

cssClass: Object of class "character" Classnames used when generating HTML tables to color entries. Generated automatically upon initialization, or modifying compareNames

outType: Object of class "character" Sets the type of output generated by ccTables. Valid types are "html", "text", "rcy3" or "none", default is "text" when the ccOptions object is initialized without an outType specified.

Methods

compareColors signature(object = "ccOptions"): ... compareColors<- signature(object = "ccOptions"): ...

compareIndx signature(object = "ccOptions"): ...

compareNames signature(object = "ccOptions"): ...

compareNames<- signature(object = "ccOptions"): ...

cssClass signature(object = "ccOptions"): ...

listNames signature(object = "ccOptions"): ...

listNames<- signature(object = "ccOptions"): ...

outType signature(object = "ccOptions"): ...

outType<- signature(object = "ccOptions"): ...
Author(s)

Robert M Flight

Examples

```r
showClass("ccOptions")
## A very basic "ccOptions" for a comparison of two sets of data, "list1" and "list2"
c1 <- new("ccOptions", listNames=c('list1','list2'))
c1

## Now lets get a little more complicated
c1 <- new("ccOptions", listNames=c('list1','list2'),
compareNames=c('list1,list2','list1,list3'), compareColors=c('red','blue'))
c1

# set the type of output you want to eventually produce
c1 <- new("ccOptions", listNames=c('list1','list2'), outType='html')
c1

c1 <- new("ccOptions", listNames=c('list1','list2'), outType=c('html','text','none'))
c1

## Using RGB colors
ccCols <- matrix(c(255,0,0, 0,0,255), nrow=2, ncol=3)
ccCols <- rgb(ccCols, maxColorValue=255)
c1 <- new("ccOptions", listNames=c('list1','list2','list3'),
compareNames=c('list1,list2','list1,list3'), compareColors=ccCols)

## Using Hex colors
cc1 <- new("ccOptions", listNames=c('list1','list2','list3'),
compareNames=c('list1,list2','list1,list3'), compareColors=c('#FF0000','#0000FF'))
c1

## or even using a color palette from R.
## Note that you need at least enough colors to cover all of individual and
## possible permutations (n!) if you use compareNames='all'
c1 <- new("ccOptions", listNames=c('list1','list2','list3'),
compareNames=c('list1,list2','list1,list3'), compareColors=rainbow(4))
c1
```

Description

Passes a ccCompareResult object to Cytoscape for interactive visualization of ccCompare results.
Details

Note that only some basic, required methods have been imported from RCy3 for use with categoryCompare, and these are hidden in the functions within categoryCompare and are not visible to the user. If access to all the functionality of RCytoscape is desired (and trust me, there is a lot of useful stuff in there), then the user should use library(RCy3) directly.

It should also be noted that deletion of edges via RCy3 is slow, so some edge filtering should be done by breakEdges prior to using ccOutCyt.

Methods

signature(ccCompRes = "ccCompareResult", ccOpts = "ccOptions", ...) At a minimum, this method requires a ccCompareResult and a ccOptions to work.

... may include:
layout = "character" to override the default layout set by ccCompare, as well as options
postText = "character" to add a user set string to the Cytoscape window
In addition, any of the arguments to CytoscapeWindow may also be set, such as host or port.

See Also

ccCompareResult ccOptions ccCompare CytoscapeWindowClass

Examples

```r
## Not run:
hasCy <- (if (.Platform$OS.type %in% "windows") {
  (length(grep("Cytoscape", system("tasklist", intern=TRUE))) > 0))
}
if hasCy {
  ccResults$BP <- breakEdges(ccResults$BP, 0.8)
  cwObj <- ccOutCyt(ccResults$BP, ccOpts)
  Sys.sleep(10)
  RCy3::deleteWindow(cwObj)
}
## End(Not run)
```

ccSigList-class  Class "ccSigList"

Description

Holds a generic list of significant annotations. Allows one to use Bioconductor annotation packages, or when combined into a GENccEnrichResult, use custom annotation / gene mappings.

Objects from the Class

Objects can be created by calls of the form new("ccSigList", ...).
Slots

sigID: Object of class "character"
categoryName: Object of class "character"
ontology: Object of class "character"
annotation: Object of class "character"

Methods

    annotation signature(object = "ccSigList"): ...
    category signature(object = "ccSigList"): ...
    ontology signature(object = "ccSigList"): ...
    sigID signature(object = "ccSigList"): ...

Author(s)

Robert M Flight

See Also

GENccEnrichResult ccCompareGeneric

Examples

    showClass("ccSigList")

Methods

signature(oldCW = "numeric", windowName = "character", ccOpts = "ccOptions") This method is now deprecated as the cwObj doesn’t store anything, but is merely the network SUID pointing to the network in Cytoscape. See RCy3::getNetworkSuid.
Methods for Function cytOutData

description

Takes the saveObj generated by cytOutNodes and writes the data to a file

Value

A text file with the annotations previously saved using cytOutNodes

Methods

signature(saveObj = "list", compareResult = "ccCompareResult", mergedData = "mergedData")

saveObj is the list object generated by cytOutNodes, compareResult is the object from
ccCompare, and mergedData is created using mergeLists, but is optional.

... : optional arguments also include: orgType, default is "header" where each group is separate, "annotate" pushes all the data into one table with a new column that designates which
groups the annotation was found in; fileName, the name of a text file to output the results to;
displayFile, whether or not to display the file (default is "FALSE")

Examples

## Not run:
hasCy <- (if (.Platform$OS.type %in% "windows") {
(length(grep("Cytoscape", system("tasklist", intern=TRUE))) > 0))}

if hasCy {
  data(ccData)
  ccResults$BP <- breakEdges(ccResults$BP, 0.8)
  cwObj <- ccOutCyt(ccResults$BP, ccOpts)
  # user selects some nodes in Cytoscape
  RCy3::selectNodes(cwObj, c("GO:0007017", "GO:0000226", "GO:0007051", "GO:0007052"))
  savedNodes <- cytOutNodes("random1", cwObj) # save them
  # and selects some other nodes
  RCy3::selectNodes(cwObj,
    c("GO:0071103", "GO:0034728", "GO:0006323", "GO:0030261", "GO:0006334"),
    preserve.current.selection=FALSE)
  savedNodes <- cytOutNodes("random2", cwObj, savedNodes)

  # now spit results out to a file
  cytOutData(savedNodes, ccResults$BP)
}

## End(Not run)
cytOutNodes-methods

Methods for Function cytOutNodes

Description

Allows export of currently selected nodes in the Cytoscape window for data export

Methods

signature(descStr = "character", cwObj = "numeric", saveObj = "list")

descStr is a string describing the nodes that are currently selected, cwObj is the Cytoscape window that the nodes are in, and then saveObj is a previously generated cytOutNodes list, and is optional.

Examples

## Not run:
hasCy <- (if (.Platform$OS.type %in% "windows") {

fdr

Number of FDR runs to perform

Description

Queries or sets the number of random runs to perform to generate an estimate of the false discovery rate. Defaults to 50

Usage

fdr(object)
Arguments

object Can be ccGeneList, HyperGParamsCC, HyperGResultCC, ccEnrichResult. See Details for more information.

Details

fdr(object) gets the number of fdr runs for ccGeneList, HyperGParamsCC, HyperGResultCC, ccEnrichResult

fdr(object)<- will set the number of fdr runs to be used by ccEnrich and HyperGTestCC when performing calculations on either a ccGeneList or HyperGParamsCC, respectively

GENccEnrichResult-class

Class "GENccEnrichResult"

Description

Holds generic ccEnrich type results

Objects from the Class

Objects can be created by calls of the form new("GENccEnrichResult", ...).

Slots

.Data: Object of class "list" The actual list containing the ccEnrichResults

categoryName: Object of class "character"

ontology: Object of class "character"

geneAnnMapping: Object of class "namedList"

graphType: Object of class "character"

names: Object of class "character"

Extends

Methods

signature(x = "GENccEnrichResult", i = "ANY", j = "ANY"): Subsets the object to just those lists that are desired

categoryName signature(object = "GENccEnrichResult"): ...

cCompareGeneric signature(gccResult = "GENccEnrichResult", ccOptions = "ccOptions"): ...

geneAnnMapping signature(object = "GENccEnrichResult"): ...

graphType signature(object = "GENccEnrichResult"): ...

graphType<- signature(object = "GENccEnrichResult"): ...

ontology signature(object = "GENccEnrichResult"): ...

Author(s)

Robert M Flight

See Also

cCompareGeneric ccSigList

Examples

data(ccData)
locA <- grep("A",gseaRes$Tissues)
locL <- grep("L",gseaRes$Tissues)
locM <- grep("M",gseaRes$Tissues)

A <- new("ccSigList",sigID=gseaRes$KEGGID[locA],categoryName="KEGG",annotation="org.Mm.eg")
L <- new("ccSigList",sigID=gseaRes$KEGGID[locL],categoryName="KEGG",annotation="org.Mm.eg")
M <- new("ccSigList",sigID=gseaRes$KEGGID[locM],categoryName="KEGG",annotation="org.Mm.eg")
ccEnrichCol <- list(A=A,L=L,M=M)
ccEnrichCol <- new("GENccEnrichResult", ccEnrichCol, categoryName="KEGG")

getGeneSymbol

Entrez to name, symbol, GO and path conversion, as well as general ID to ID conversion.

Description

Get different attributes for the Entrez gene Ids

Usage

getGeneSymbol(id, annPackage)
getGeneName(id, annPackage)
getGO2ALLEGS(id, annPackage)
getPATH2EG(id, annPackage)
getAnnotation(id, annPackage, mapID, doUnlist=TRUE)
Arguments

- `id`: The IDs one wants to get information for.
- `annPackage`: Which annotation package to use.
- `mapID`: Which mapping to use.
- `doUnlist`: Should the results be unlisted or not?

Details

The type of ID will change depending on the function. For `getGene...` the ID should be Entrez IDs. For `getGO2ALLEGS` Gene Ontology IDs should be used, and for `getPATH2EG` KEGG pathways IDs should be used. For `getAnnotation`, any ID can be used.

Value

Returns the requested information.

Note

These functions are generally called internally for mapping between genes and various objects.

Author(s)

Robert M Flight

---

**Description**

Gets and sets the `graphType` for a couple of different `ccEnrichResult` objects.

**Methods**

- `signature(object = "ccEnrichResult")`
- `signature(object = "GENccEnrichResult")`

**See Also**

`ccEnrichResult` `GENccEnrichResult`
Class "HyperGParamsCC"

Description

This class extends the HyperGParams class in Category by providing options for multiple testing and the storing of extra data in addition to the gene list of interest (not currently used, but might be in the future).

Objects from the Class

Objects can be created by calls of the form `new("HyperGParamsCC", ...)`. In general the user will not create these directly, but they are created and used by to carry out the enrichment calculations.

Slots

- `fdr`: Object of class "numeric" The number of FDR runs to perform
- `data`: Object of class "data.frame" Extra data stored in the object
- `geneIds`: Object of class "ANY" The genes of interest
- `universeGeneIds`: Object of class "ANY" The gene universe or background used (all the genes on the chip)
- `annotation`: Object of class "character" The annotation package used to get information about the geneIds
- `datPkg`: Object of class "DatPkg" Generated automatically from the annotation slot
- `categorySubsetIds`: Object of class "ANY" A specific set of category IDs that one wants to restrict the testing to
- `categoryName`: Object of class "character" What type of category to use, currently either "GO" or "KEGG"
- `pvalueCutoff`: Object of class "numeric" What should be the p-value to decide significance
- `testDirection`: Object of class "character" "over" or "under" represented annotation terms

Extends

Class "GOHyperGParams", directly.

Methods

No methods defined with class "HyperGParamsCC" in the signature.

Author(s)

Robert M Flight

HyperGResultCC ccEnrich Category-package
Examples

showClass("HyperGParamsCC")

HyperGResultCC-class  Class "HyperGResultCC"

Description

Contains the results of performing a hypergeometric test on a HyperGParams object.

Objects from the Class

Objects can be created by calls of the form new("HyperGResultCC", ...).

Slots

- **fdr**: Object of class "numeric" The number of FDR runs performed
- **fdrvalues**: Object of class "numeric" The FDR values generated
- **pvalueType**: Object of class "character" Whether to use p-values or FDR values in determining the significant terms returned
- **data**: Object of class "data.frame" Extra data
- **pvalues**: Object of class "numeric" P-values calculated for each term
- **oddsRatios**: Object of class "numeric"
- **expectedCounts**: Object of class "numeric"
- **catToGeneId**: Object of class "list"
- **organism**: Object of class "character"
- **annotation**: Object of class "character"
- **geneIds**: Object of class "ANY"
- **testName**: Object of class "character"
- **pvalueCutoff**: Object of class "numeric"
- **testDirection**: Object of class "character"

Extends

Class "HyperGResult", directly. Class "HyperGResultBase", by class "HyperGResult", distance 2.
Methods

- **fdr** signature(object = "HyperGResultCC"): ...
- **fdrvalues** signature(object = "HyperGResultCC"): ...
- **pCC** signature(object = "HyperGResultCC"): ...

Examples

```r
showClass("HyperGResultCC")
```

---

**hyperGTestCC**  
*Hypergeometric testing with false discovery rate*

Description

Performs the hypergeometric testing for HyperGParamsCC objects.

Usage

```r
hyperGTestCC(p)
```

Arguments

- **p**  
  A HyperGParamsCC object

Details

This is the heart of categoryCompare, the function that calculates the HyperGeometric statistics for the given categories of annotation for each gene list.

Value

Returns a HyperGResultCC object
listNames

Description

Extracts the listNames from ccGeneList or ccOptions objects.

Usage

listNames(object)

Arguments

object This will be either a ccGeneList or ccOptions object

Author(s)

Robert M Flight

See Also

ccGeneList ccOptions
mergedData-class  

Class "mergedData"

Description
Stores merged data tables from the "data" entry in a ccGeneList. This is useful for output later.

Objects from the Class
Objects can be created by calls of the form new("mergedData", ...).

Slots
.Data: Object of class "list"
useIDName: Object of class "character"
names: Object of class "character"
row.names: Object of class "data.frameRowLabels"
.S3Class: Object of class "character"

Extends
Class "data.frame", directly. Class "list", by class "data.frame", distance 2. Class "oldClass", by class "data.frame", distance 2. Class "data.frameOrNULL", by class "data.frame", distance 2. Class "vector", by class "data.frame", distance 3.

Methods
signature(saveObj = "list", compareResult = "ccCompareResult", mergedData = "mergedData")

Author(s)
Robert M. Flight

See Also
mergeLists cytOutData

Examples
showClass("mergedData")
data(ccData)
mergeDat <- mergeLists(geneLists, ccOpts)
Function `mergeLists` in Package `categoryCompare`

Description

Merges the gene lists or the data tables from a `ccGeneList` object, providing a single table with all the input data, that can then be queried later, using `cytTableOut`.

Usage

```r
mergeLists(ccGeneList, ccOptions, isGene = TRUE)
```

Arguments

- `ccGeneList`: a `ccGeneList` object
- `ccOptions`: a `ccOptions` object
- `isGene`: are the identifiers genes, or something else (metabolites, etc)

Value

A `mergedData` object which is really just a glorified data frame. If the `ccGeneList` input had a `data` list, then these are all merged into a single table. Otherwise, it contains just the gene names and which list they were present in.

Methods

```r
signature(ccGeneList = "ccGeneList", ccOptions = "ccOptions")
```

See Also

- `ccGeneList`
- `ccOptions`
- `mergedData`

Examples

```r
data(ccData)
g10 <- (unique(table10$Entrez[1:100]))
g48 <- (unique(table48$Entrez[1:100]))

list10 <- list(genes = g10, universe = gUniverse, annotation = "org.Hs.eg.db", data = table10[1:100,])
list48 <- list(genes = g48, universe = gUniverse, annotation = "org.Hs.eg.db", data = table48[1:100,])

geneLists <- list(T10 = list10, T48 = list48)
geneLists <- new("ccGeneList", geneLists, ccType = c("BP", "KEGG"))
ccOpts <- new("ccOptions", listNames = names(geneLists))
mergedDat <- mergeLists(geneLists, ccOpts)

list10 <- list(genes = g10, universe = gUniverse, annotation = "org.Hs.eg.db")
list48 <- list(genes = g48, universe = gUniverse, annotation = "org.Hs.eg.db")
```
```r
geneLists <- list(T10=list10, T48=list48)
geneLists <- new("ccGeneList", geneLists, ccType=c("BP","KEGG"))
ccOpts <- new("ccOptions", listNames = names(geneLists))
mergedDat <- mergeLists(geneLists,ccOpts)
```

---

### Description

Extracts and sets the minimum number of genes that an annotation must have to be considered in subsequent steps.

### Usage

```r
minCount(object)
```

### Arguments

- **object**: This will be either a `HyperGResultCC`, `ccEnrichResult`, or `ccEnrichCollection` object. See Details for more information.

### Details

- `minCount(object)` fetches the set `minCount` for `HyperGResultCC` and `ccEnrichResult` objects
- `minCount(object) <-` will set the `minCount` for `HyperGResultCC` objects, and when applied to `ccEnrichResult` and `ccEnrichCollection` sets the `minCount` for all of the contained objects, so be careful if you want to use different `minCounts` for different results

### Author(s)

Robert M Flight

### See Also

- `HyperGResultCC`
- `ccEnrichResult`
- `ccEnrichCollection`

### Examples

```r
data(ccData)
enrichLists
minCount(enrichLists) <- 5
enrichLists
```
**minNodes**

_delete nodes with less than a certain number of genes annotated_

**Description**

Deletes from the graph those annotations with less than a certain number of genes.

**Usage**

```
minNodes(cwObj, cutoff)
```

**Arguments**

- `cwObj`: a CytoscapeWindowClass object returned from `ccOutCyt`
- `cutoff`: the minimum number of genes that an annotation must have

**Author(s)**

Robert M Flight

**See Also**

CytoscapeWindowClass `ccOutCyt`

**Examples**

```r
## Not run:
hasCy <- (if (.Platform$OS.type %in% "windows") {
  (length(grep("Cytoscape", system("tasklist", intern=TRUE))) > 0))
}

if hasCy {
  data(ccData)
  ccResults$BP <- breakEdges(ccResults$BP, 0.8)
  cwObj <- ccOutCyt(ccResults$BP, ccOpts)
  minNodes(cwObj, 5)
}
## End(Not run)
```
### pvalueType

**Type of p-values to return from object**

**Description**

Queries or sets the type of p-values to return from objects, either base calculated (pvals) or from fdr calculations (fdr)

**Usage**

`pvalueType(object)`

**Arguments**

- `object` can be `HyperGResultCC`, `ccEnrichResult`, `ccEnrichCollection`. See Details for more information

**Details**

`pvalueType(object)` gets the type of p-values to be returned from `HyperGResultCC` and `ccEnrichResult` objects

`pvalueType(object) <-` will set the type of p-values to be returned from `HyperGResultCC`, `ccEnrichResult`, `ccEnrichCollection`. Note that for a `ccEnrichCollection`, the type is changed for all contained `ccEnrichResults`

**Author(s)**

Robert M Flight

**See Also**

`HyperGResultCC ccEnrichResult ccEnrichCollection`

**Examples**

```r
# pvalueType-Methods
data(ccData)

## Not run: pvalueType(enrichLists) # this returns an error
pvalueType(enrichLists[[1]])
pvalueType(enrichLists[[1]][[1]])

# change the type for one of the results
pvalueType(enrichLists[[1]]) <- 'pval' # Not recommended practice
enrichLists

# change for all of the results
pvalueType(enrichLists) <- 'pval'
enrichLists
```
Description

If the color of particular nodes have been modified from the original color scheme in ccOptions, this will reset them

Methods

signature(cwObj = "numeric", ccOpts = "ccOptions") What CytoscapeWindow to apply this to, and what ccOptions to use for the color scheme.

Optional Arguments: Note that optional arguments include node.attribute.name (default is 'fillcolor') and mode (default is 'lookup')
