Package ‘cola’

February 18, 2024

Type Package
Title A Framework for Consensus Partitioning
Version 2.8.0
Date 2023-04-21
Depends R (>= 3.6.0)
Imports grDevices, graphics, grid, stats, utils, ComplexHeatmap (>= 2.5.4), matrixStats, GetoptLong, circlize (>= 0.4.7), GlobalOptions (>= 0.1.0), clue, parallel, RColorBrewer, cluster, skmeans, png, mclust, crayon, methods, xml2, microbenchmark, httr, knitr (>= 1.4.0), markdown (>= 1.6), digest, impute, brew, Rcpp (>= 0.11.0), BiocGenerics, eulerr, foreach, doParallel, doRNG, irlba
Suggests genefilter, mvtnorm, testthat (>= 0.3), samr, pamr, kohonen, NMF, WGCNA, Rtsne, umap, clusterProfiler, ReactomePA, DOSE, AnnotationDbi, gplots, hu6800.db, BiocManager, data.tree, dendextend, Polychrome, rmarkdown, simplifiyEnrichment, cowplot, flexclust, randomForest, e1071

Description Subgroup classification is a basic task in genomic data analysis, especially for gene expression and DNA methylation data analysis. It can also be used to test the agreement to known clinical annotations, or to test whether there exist significant batch effects. The cola package provides a general framework for subgroup classification by consensus partitioning. It has the following features: 1. It modularizes the consensus partitioning processes that various methods can be easily integrated. 2. It provides rich visualizations for interpreting the results. 3. It allows running multiple methods at the same time and provides functionalities to straightforward compare results. 4. It provides a new method to extract features which are more efficient to separate subgroups. 5. It automatically generates detailed reports for the complete analysis. 6. It allows applying consensus partitioning in a hierarchical manner.

**Description**

Remove rows with low variance and impute missing values

**Usage**

```r
adjust_matrix(m, sd_quantile = 0.05, max_na = 0.25, verbose = TRUE)
```

**Arguments**

- `m`: A numeric matrix.
- `sd_quantile`: Cutoff of the quantile of standard deviation. Rows with standard deviation less than it are removed.
- `max_na`: Maximum NA fraction in each row. Rows with NA fraction larger than it are removed.
- `verbose`: Whether to print messages.

**Details**

The function uses `impute.knn` to impute missing values, then uses `adjust_outlier` to adjust outliers and removes rows with low standard deviations.

**Value**

A numeric matrix.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```r
set.seed(123)
m = matrix(rnorm(100), nrow = 10)
m[sample(length(m), 5)] = NA
m[1, ] = 0
m
m2 = adjust_matrix(m)
m2
```
adjust_outlier

Description

Adjust outliers

Usage

adjust_outlier(x, q = 0.05)

Arguments

x A numeric vector.
q Percentile to adjust.

Details

Values larger than percentile 1 - q are adjusted to the 1 - q percentile and values smaller than percentile q are adjusted to the q percentile

Value

A numeric vector with same length as the original one.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

set.seed(123)
x = rnorm(40)
x[1] = 100
adjust_outlier(x)
all_leaves-HierarchicalPartition-method

*All leaves in the hierarchy*

**Description**

All leaves in the hierarchy

**Usage**

```r
## S4 method for signature 'HierarchicalPartition'
all_leaves(object, merge_node = merge_node_param())
```

**Arguments**

- `merge_node`: Parameters to merge sub-dendrograms, see `merge_node_param`.

**Value**

A vector of node ID.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```r
data(golub_cola_rh)
all_leaves(golub_cola_rh)
```

all_nodes-HierarchicalPartition-method

*All nodes in the hierarchy*

**Description**

All nodes in the hierarchy

**Usage**

```r
## S4 method for signature 'HierarchicalPartition'
all_nodes(object, merge_node = merge_node_param())
```

**Examples**

```r
```
**all_partition_methods**

**Arguments**

- **object**  
  A `HierarchicalPartition-class` object.
- **merge_node**  
  Parameters to merge sub-dendrograms, see `merge_node_param`.

**Value**

A vector of node ID.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```r
data(golub_cola_rh)
all_nodes(golub_cola_rh)
```

---

**Description**

All supported partitioning methods

**Usage**

```r
all_partition_methods()
```

**Details**

New partitioning methods can be registered by `register_partition_methods`.

**Value**

A vector of supported partitioning methods.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```r
all_partition_methods()
```
**all_top_value_methods  All supported top-value methods**

**Description**
All supported top-value methods

**Usage**
```
all_top_value_methods()
```

**Details**
New top-value methods can be registered by `register_top_value_methods`.

**Value**
A vector of supported top-value methods.

**Author(s)**
Zuguang Gu <z.gu@dkfz.de>

**Examples**
```
all_top_value_methods()
```

---

**aPAC  Adapted PAC scores**

**Description**
Adapted PAC scores

**Usage**
```
aPAC(consensus_mat)
```

**Arguments**
- `consensus_mat`  A consensus matrix.
Details
For the consensus values x, it is transformed to 1 - x if x < 0.5. After the transformation, for any pair of samples in the consensus matrix. If they are always in the same group or always in different groups, the value x is both to 1. Thus, if the consensus matrix shows stable partitions, values x will be all close to 1. Reflected in the CDF of x, the curve is shifted to the right and the area under CDF curve should be very small.

An aPAC value less than 0.05 is considered as the stable partition, which can be thought the proportion of ambiguous partitioning is less than 0.05.

Value
A numeric value.

Examples
```r
data(golub_cola)
aPAC(get_consensus(golub_cola[1, 1], k = 2))
aPAC(get_consensus(golub_cola[1, 1], k = 3))
aPAC(get_consensus(golub_cola[1, 1], k = 4))
aPAC(get_consensus(golub_cola[1, 1], k = 5))
aPAC(get_consensus(golub_cola[1, 1], k = 6))
```

Description
Ability to correlate to other rows

Usage
```r
ATC(mat, cor_fun = stats::cor, min_cor = 0, power = 1, k_neighbours = -1, group = NULL, mc.cores = 1, cores = mc.cores, ...)
```

Arguments
- **mat**: A numeric matrix. ATC score is calculated by rows.
- **cor_fun**: A function which calculates correlations.
- **min_cor**: Cutoff for the minimal absolute correlation.
- **power**: Power on the correlation values.
- **k_neighbours**: Nearest k neighbours.
- **mc.cores**: Number of cores. This argument will be removed in future versions.
- **cores**: Number of cores.
- **group**: A categorical variable. If it is specified, the correlation is only calculated for the rows in the same group as current row.
- **...**: Pass to cor_fun.
Details

For a given row in a matrix, the ATC score is the area above the curve of the cumulative density distribution of the absolute correlation to all other rows. Formally, if $F_i(X)$ is the cumulative distribution function of $X$ where $X$ is the absolute correlation for row $i$ with power power (i.e. $x = \text{cor}^{\text{power}}$), $\text{ATC}_i = 1 - \int_{\text{min_cor}}^{1} F_i(X)$.

By default the ATC scores are calculated by Pearson correlation, to use Spearman correlation, you can register a new top-value method by:

```r
register_top_value_methods(
    "ATC_spearman" = function(m) ATC(m, method = "spearman")
)
```

Similarly, to use a robust correlation method, e.g. `bicor` function, you can do like:

```r
register_top_value_methods(
    "ATC_bicor" = function(m) ATC(m, cor_fun = WGCNA::bicor)
)
```

If the number of rows exceeds 30000, it internally uses `ATC_approx`.

Value

A vector of numeric values with the same order as rows in the input matrix.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

See Also

[https://jokergoo.github.io/cola_supplementary/suppl_1_ATC/suppl_1_ATC.html](https://jokergoo.github.io/cola_supplementary/suppl_1_ATC/suppl_1_ATC.html)

Examples

```r
set.seed(12345)

nr1 = 100
mat1 = matrix(rnorm(100*nr1), nrow = nr1)

nr2 = 10
require(mvtnorm)
sigma = matrix(0.8, nrow = nr2, ncol = nr2); diag(sigma) = 1
mat2 = t(rmvnorm(100, mean = rep(0, nr2), sigma = sigma))

nr3 = 50
sigma = matrix(0.5, nrow = nr3, ncol = nr3); diag(sigma) = 1
mat3 = t(rmvnorm(100, mean = rep(0, nr3), sigma = sigma))

mat = rbind(mat1, mat2, mat3)
ATC_score = ATC(mat)
plot(ATC_score, pch = 16, col = c(rep(1, nr1), rep(2, nr2), rep(3, nr3)))
```
ATC_approx

Ability to correlate to other rows - an approximated method

Description

Ability to correlate to other rows - an approximated method

Usage

ATC_approx(mat, cor_fun = stats::cor, min_cor = 0, power = 1, k_neighbours = -1, mc.cores = 1, cores = mc.cores, n_sampling = c(1000, 500), group = NULL, ...)

Arguments

mat A numeric matrix. ATC score is calculated by rows.
cor_fun A function which calculates correlations on matrix rows.
min_cor Cutoff for the minimal absolute correlation.
power Power on the correlation values.
k_neighbours Nearest k neighbours. Note when this argument is set, there won’t be subset sampling for calculating correlations, which means, it will calculate correlation to all other rows.
mc.cores Number of cores. This argument will be removed in future versions.
cores Number of cores.
n_sampling When there are too many rows in the matrix, to get the cumulative distribution of how one row correlates other rows, actually we don’t need to use all the rows in the matrix, e.g. 1000 rows can already give a very nice estimation.
group A categorical variable. If it is specified, the correlation is only calculated for the rows in the same group as current row.
... Pass to cor_fun.

details

For a matrix with huge number of rows. It is not possible to calculate correlation to all other rows, thus the correlation is only calculated for a randomly sampled subset of other rows.

With small numbers of rows of the matrix, ATC should be used which calculates the "exact" ATC value, but the value of ATC and ATC_approx should be very similar.

Examples

# There is no example
NULL
**Description**

A bottle of cola

**Usage**

`cola()`

**Details**

Simply serve you a bottle of cola.

The ASCII art is from [http://ascii.co.uk/art/coke](http://ascii.co.uk/art/coke).

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```r
for(i in 1:10) cola()
```

---

**Description**

Global parameters

**Usage**

`cola_opt(..., RESET = FALSE, READ.ONLY = NULL, LOCAL = FALSE, ADD = FALSE)`

**Arguments**

- `...` Arguments for the parameters, see "details" section.
- `RESET` Whether to reset to default values.
- `READ.ONLY` Please ignore.
- `LOCAL` Please ignore.
- `ADD` Please ignore.
Details

There are following global parameters:

- `group_diff` Used in `get_signatures,ConsensusPartition-method` to globally control the minimal difference between subgroups.
- `fdr_cutoff` Used in `get_signatures,ConsensusPartition-method` to globally control the cut-off of FDR for the differential signature tests.
- `color_set_2` Colors for the predicted subgroups.
- `help` Whether to print help messages.
- `message` Whether to print messages.

Examples

```r
cola_opt
cola_opt$group_diff = 0.2  # e.g. for methylation datasets
cola_opt$fdr_cutoff = 0.1  # e.g. for methylation datasets
cola_opt
cola_opt(RESET = TRUE)
```

Description

Make HTML report from the ConsensusPartition object

Usage

```r
## S4 method for signature 'ConsensusPartition'
cola_report(object, output_dir = getwd(),
title = qq("cola Report for Consensus Partitioning (@{object@top_value_method}:@{object@partition_method})"),
env = parent.frame())
```

Arguments

- `object` A `ConsensusPartition-class` object.
- `output_dir` The output directory where the report is saved.
- `title` Title of the report.
- `env` Where the objects in the report are found, internally used.

Details

It generates report for a specific combination of top-value method and partitioning method.
Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

See Also

cola_report, ConsensusPartitionList-method

Examples

# There is no example
NULL

## S4 method for signature 'ConsensusPartitionList'

cola_report(object, output_dir = getwd(), mc.cores = 1, cores = mc.cores, title = "cola Report for Consensus Partitioning", env = parent.frame())

Arguments

- **object**: A ConsensusPartitionList-class object.
- **output_dir**: The output directory where the report is saved.
- **mc.cores**: Multiple cores to use. This argument will be removed in future versions.
- **cores**: Number of cores, or a cluster object returned by makeCluster.
- **title**: Title of the report.
- **env**: Where the objects in the report are found, internally used.

Details

The ConsensusPartitionList-class object contains results for all combinations of top-value methods and partitioning methods. This function generates a HTML report which contains all plots and tables for every combination of method.

The report generation may take a while because it generates A LOT of heatmaps.

Examples of reports can be found at https://jokergoo.github.io/cola_collection/.
Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

if(FALSE) {
  # the following code is runnable
  data(golub_cola)
  cola_report(golub_cola[c("SD", "MAD"), c("hclust", "skmeans")], output_dir = "~/test_cola_cl_report")
}

Description

Method dispatch page for cola_report.

Dispatch

cola_report can be dispatched on following classes:

- cola_report,HierarchicalPartition-method,HierarchicalPartition-class class method
- cola_report,ConsensusPartition-method,ConsensusPartition-class class method
- cola_report,ConsensusPartitionList-method,ConsensusPartitionList-class class method

Examples

# no example
NULL
Description

Make HTML report from the HierarchicalPartition object

Usage

```r
## S4 method for signature 'HierarchicalPartition'
cola_report(object, output_dir = getwd(), mc.cores = 1, cores = mc.cores,
title = qq("cola Report for Hierarchical Partitioning"),
env = parent.frame())
```

Arguments

- `output_dir`: The output directory where the report is put.
- `mc.cores`: Multiple cores to use. This argument will be removed in future versions.
- `cores`: Number of cores, or a cluster object returned by `makeCluster`.
- `title`: Title of the report.
- `env`: Where the objects in the report are found, internally used.

Details

This function generates a HTML report which contains all plots for all nodes in the partition hierarchy.

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

```r
if(FALSE) {
  # the following code is runnable
  data(golub_cola_rh)
  cola_report(golub_cola_rh, output_dir = "~/test_cola_rh_report")
}
Example ConsensusPartitionList object

Description

Example ConsensusPartitionList object

Usage

data(cola_r1)

Details

Following code was used to generate cola_r1:

```r
set.seed(123)
m = cbind(rbind(matrix(rnorm(20*20, mean = 1, sd = 0.5), nr = 20),
               matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20),
               matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20)),
          rbind(matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20),
                matrix(rnorm(20*20, mean = 1, sd = 0.5), nr = 20),
                matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20)),
          rbind(matrix(rnorm(20*20, mean = 0.5, sd = 0.5), nr = 20),
                matrix(rnorm(20*20, mean = 0.5, sd = 0.5), nr = 20),
                matrix(rnorm(20*20, mean = 1, sd = 0.5), nr = 20))) +
        matrix(rnorm(60*60, sd = 0.5), nr = 60)
cola_r1 = run_all_consensus_partition_methods(data = m, cores = 6)
```

cola_r1

collect_classes-ConsensusPartition-method

Collect subgroups from ConsensusPartition object

Description

Collect subgroups from ConsensusPartition object
Usage

```r
## S4 method for signature 'ConsensusPartition'
collect_classes(object, internal = FALSE,
    show_row_names = FALSE, row_names_gp = gpar(fontsize = 8),
    anno = object@anno, anno_col = object@anno_col)
```

Arguments

- `internal`: Used internally.
- `show_row_names`: Whether to show row names in the heatmap (which is the column name in the original matrix).
- `row_names_gp`: Graphics parameters for row names.
- `anno`: A data frame of annotations for the original matrix columns. By default it uses the annotations specified in `consensus_partition` or `run_all_consensus_partition_methods`.
- `anno_col`: A list of colors (color is defined as a named vector) for the annotations. If `anno` is a data frame, `anno_col` should be a named list where names correspond to the column names in `anno`.

Details

The percent membership matrix and the subgroup labels for each k are plotted in the heatmaps. 
Same row in all heatmaps corresponds to the same column in the original matrix.

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

```r
data(golub_cola)
collect_classes(golub_cola["ATC", "skmeans"])
```

---

Collect classes from ConsensusPartitionList object

Description

Collect classes from ConsensusPartitionList object
Usage

```r
## S4 method for signature 'ConsensusPartitionList'
collect_classes(object, k, show_column_names = FALSE,
column_names_gp = gpar(fontsize = 8),
anno = get_anno(object), anno_col = get_anno_col(object),
simplify = FALSE, ...)
```

Arguments

- `object`: A `ConsensusPartitionList-class` object returned by `run_all_consensus_partition_methods`.
- `k`: Number of subgroups.
- `show_column_names`: Whether to show column names in the heatmap (which is the column name in the original matrix).
- `column_names_gp`: Graphics parameters for column names.
- `anno`: A data frame of annotations for the original matrix columns. By default it uses the annotations specified in `run_all_consensus_partition_methods`.
- `anno_col`: A list of colors (color is defined as a named vector) for the annotations. If `anno` is a data frame, `anno_col` should be a named list where names correspond to the column names in `anno`.
- `simplify`: Internally used.
- `...`: Pass to `draw,HeatmapList-method`.

Details

There are following panels in the plot:

- a heatmap showing partitions predicted from all methods where the top annotation is the consensus partition summarized from partitions from all methods, weighted by mean silhouette scores in every single method.
- a row barplot annotation showing the mean silhouette scores for different methods.

The row clustering is applied on the dissimilarity matrix calculated by `cl_dissimilarity` with the comembership method.

The brightness of the color corresponds to the silhouette scores for the consensus partition in each method.

Value

No value is returned.

<tr>
<td>verbose</td>
<td>Whether print messages.</td>
</tr>
</tbody>
</table>
collect_plots-ConsensusPartitionList-method

Details

Plots by `plot.ecdf`, `collect_classes`, `ConsensusPartition-method`, `consensus_heatmap`, `membership_heatmap` and `get_signatures` are arranged in one single page, for all available k.

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

See Also

`collect_plots`, `ConsensusPartitionList-method` collects plots for the `ConsensusPartitionList-class` object.

Examples

data(golub_cola)
collect_plots(golub_cola["ATC", "skmeans"])

Description

Collect plots from ConsensusPartitionList object

Usage

```r
## S4 method for signature 'ConsensusPartitionList'
collect_plots(object, k = 2, fun = consensus_heatmap,
              top_value_method = object@top_value_method,
              partition_method = object@partition_method,
              verbose = TRUE, mc.cores = 1, cores = mc.cores, ...)
```

Arguments

- `object`: A `ConsensusPartitionList-class` object from `run_all_consensus_partition_methods`.
- `k`: Number of subgroups.
- `fun`: Function used to generate plots. Valid functions are `consensus_heatmap`, `plot.ecdf`, `membership_heatmap`, `get_signatures` and `dimension_reduction`.
- `top_value_method`: A vector of top-value methods.
collect_plots-dispatch

partition_method
A vector of partitioning methods.

verbose
Whether to print message.

mc.cores
Number of cores. This argument will be removed in figure versions.

cores
Number of cores, or a cluster object returned by `makeCluster`.

... other Arguments passed to corresponding `fun`.

Details
Plots for all combinations of top-value methods and parittioning methods are arranged in one single page.
This function makes it easy to directly compare results from multiple methods.

Value
No value is returned.

Author(s)
Zuguang Gu <z.gu@dkfz.de>

See Also
collect_plots,ConsensusPartition-method collects plots for a single ConsensusPartition-class object.

Examples
data(golub_cola)
collect_plots(cola_rl, k = 3)
collect_plots(cola_rl, k = 3, fun = membership_heatmap)
collect_plots(cola_rl, k = 3, fun = get_signatures)

Description
Method dispatch page for collect_plots.

Dispatch
collect_plots can be dispatched on following classes:

- collect_plots,ConsensusPartition-method,ConsensusPartition-class class method
- collect_plots,ConsensusPartitionList-method,ConsensusPartitionList-class class method
Description

Draw and compare statistics for a single method

Usage

```r
## S4 method for signature 'ConsensusPartition'
collect_stats(object, ...)
```

Arguments

- `object` A `ConsensusPartition-class` object.
- `...` Other arguments.

Details

It is identical to `select_partition_number,ConsensusPartition-method`.

Examples

```r
# There is no example
NULL
```

description

Draw and compare statistics for multiple methods

Usage

```r
## S4 method for signature 'ConsensusPartitionList'
collect_stats(object, k, layout_nrow = 2, all_stats = FALSE, ...)
```
**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>A ConsensusPartitionList-class object.</td>
</tr>
<tr>
<td>k</td>
<td>Number of subgroups.</td>
</tr>
<tr>
<td>layout_nrow</td>
<td>Number of rows in the layout</td>
</tr>
<tr>
<td>all_stats</td>
<td>Whether to show all statistics that were calculated. Used internally.</td>
</tr>
<tr>
<td>...</td>
<td>Other arguments</td>
</tr>
</tbody>
</table>

**Details**

It draws heatmaps for statistics for multiple methods in parallel, so that users can compare which combination of methods gives the best results with given the number of subgroups.

**Examples**

```r
data(golub_cola)
collect_stats(golub_cola, k = 3)
```

---

**Description**

Method dispatch page for collect_stats.

**Dispatch**

collect_stats can be dispatched on following classes:

- `collect_stats,ConsensusPartitionList-method,ConsensusPartitionList-class` class method
- `collect_stats,ConsensusPartition-method,ConsensusPartition-class` class method

**Examples**

```
# no example
NULL
```

**Description**

Column names of the matrix

**Usage**

```r
## S4 method for signature 'ConsensusPartition'
colnames(x)
```

**Arguments**

- `x` A `ConsensusPartition-class` object.

**Examples**

```r
# There is no example
NULL
```
Method dispatch page for `colnames`.

### Description

Method dispatch page for `colnames`.

### Dispatch

`colnames` can be dispatched on following classes:

- `colnames,ConsensusPartition-method,ConsensusPartition-class` class method
- `colnames,ConsensusPartitionList-method,ConsensusPartitionList-class` class method
- `colnames,DownSamplingConsensusPartition-method,DownSamplingConsensusPartition-class` class method
- `colnames,HierarchicalPartition-method,HierarchicalPartition-class` class method

### Examples

```r
# no example
NULL
```

---

**`colnames-DownSamplingConsensusPartition-method`**

*Column names of the matrix*

### Description

Column names of the matrix

### Usage

```r
## S4 method for signature 'DownSamplingConsensusPartition'
colnames(x)
```

### Arguments

- `x` A `DownSamplingConsensusPartition-class` object.

### Examples

```r
# There is no example
NULL
```
colnames-HierarchicalPartition-method

Column names of the matrix

Description

Column names of the matrix

Usage

## S4 method for signature 'HierarchicalPartition'

\texttt{colnames(x)}

Arguments

\textbf{x} \hspace{1cm} A \texttt{HierarchicalPartition-class} object.

Examples

# There is no example

NULL

compare_partitions-ConsensusPartition-method

Compare two partitionings

Description

Compare two partitionings

Usage

## S4 method for signature 'ConsensusPartition'

\texttt{compare_partitions(object, object2, output_file, k1 = 2, k2 = 2,}
\texttt{ dimension_reduction_method = "UMAP",}
\texttt{ id_mapping = guess_id_mapping(rownames(object), "org.Hs.eg.db", FALSE),}
\texttt{ row_km1 = ifelse(k1 == 2, 2, 1),}
\texttt{ row_km2 = ifelse(k1 == 2 && k2 == 2, 2, 1),}
\texttt{ row_km3 = ifelse(k2 == 2, 2, 1))}
Arguments

object A `ConsensusPartition` object.
object2 A `ConsensusPartition` object.
output_file The path of the output HTML file. If it is not specified, the report will be opened in the web browser.
k1 Number of subgroups in object.
k2 Number of subgroups in object2.
dimension_reduction_method Which dimension reduction method to use.
id_mapping Pass to `functional_enrichment,ConsensusPartition-method`.
row_km1 Number of k-means groups, see Details.
row_km2 Number of k-means groups, see Details.
row_km3 Number of k-means groups, see Details.

Details

The function produces a HTML report which includes comparisons between two partitioning results.

In the report, there are three heatmaps which visualize A) the signature genes specific in the first partition, B) the signature genes both in the two partitionings and C) the signatures genes specific in the second partition. Argument `row_km1, row_km2 and row_km3` control how many k-means groups should be applied on the three heatmaps.

Examples

```r
## Not run:
data(golub_cola)
require(hu6800.db)
x = hu6800ENTREZID
mapped_probes = mappedkeys(x)
id_mapping = unlist(as.list(x[mapped_probes]))
compare_partitions(golub_cola["ATC:skmeans"], golub_cola["SD:kmeans"],
                  id_mapping = id_mapping)
## End(Not run)
```

Description

Compare Signatures from Different k
Usage

```r
## S4 method for signature 'ConsensusPartition'
compare_signatures(object, k = object@k, verbose = interactive(), ...)
```

Arguments

- `k`: Number of subgroups. Value should be a vector.
- `verbose`: Whether to print message.
- `...`: Other arguments passed to `get_signatures,ConsensusPartition-method`.

Details

It plots an Euler diagram showing the overlap of signatures from different k.

Examples

```r
data(golub_cola)
res = golub_cola["ATC", "skmeans"]
compare_signatures(res)
```
compare_signatures-HierarchicalPartition-method

Compare Signatures from Different Nodes

Description

Compare Signatures from Different Nodes

Usage

## S4 method for signature 'HierarchicalPartition'
compare_signatures(object, merge_node = merge_node_param(),
   method = c("euler", "upset"), upset_max_comb_sets = 20,
   verbose = interactive(), ...)

Arguments

- merge_node: Parameters to merge sub-dendrograms, see merge_node_param.
- method: Method to visualize.
- upset_max_comb_sets: Maximal number of combination sets to show.
- verbose: Whether to print message.
- ...: Other arguments passed to get_signatures,HierarchicalPartition-method.

Details

It plots an Euler diagram or a UpSet plot showing the overlap of signatures from different nodes. On each node, the number of subgroups is inferred by suggest_best_k,ConsensusPartition-method.

Examples

data(golub_cola_rh)
compare_signatures(golub_cola_rh)

concordance

Concordance to the consensus partition

Description

Concordance to the consensus partition

Usage

concordance(membership_each, class)
Arguments

membership_each
A matrix which contains partitions in every single runs where columns correspond to runs. The object can be get from get_membership(..., each = TRUE).

class
Consensus subgroup labels.

Details

Note subgroup labels in membership_each should already be adjusted to the consensus labels, i.e. by relabel_class.
The concordance score is the mean proportion of samples having the same subgroup labels as the consensus labels among individual partition runs.

Value

A numeric value.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

data(golub_cola)
membership_each = get_membership(golub_cola["SD", "kmeans"], each = TRUE, k = 3)
consensus_classes = get_classes(golub_cola["SD", "kmeans"], k = 3)$class
cordance(membership_each, consensus_classes)

---

config_ATC

Adjust parameters for default ATC method

Description

Adjust parameters for default ATC method

Usage

config_ATC(cor_fun = stats::cor, min_cor = 0, power = 1, k_neighbours = -1, group = NULL, cores = 1, ...)

Arguments

cor_fun
A function that calculates correlations from a matrix (on matrix rows).

min_cor
Cutoff for the minimal absolute correlation.

power
Power on the correlation values.

k_neighbours
Number of the closest neighbours to use.
The **ConsensusPartition-class** has following methods:

- **consensus_partition**: constructor method, run consensus partitioning with a specified top-value method and a partitioning method.
- **select_partition_number,ConsensusPartition-method**: make a list of plots for selecting optimized number of subgroups.
- **consensus_heatmap,ConsensusPartition-method**: make heatmap of the consensus matrix.
- **membership_heatmap,ConsensusPartition-method**: make heatmap of the membership for individual partitions.
- **get_signatures,ConsensusPartition-method**: get the signature rows and make heatmap.
- **dimension_reduction,ConsensusPartition-method**: make dimension reduction plots.
- **collect_plots,ConsensusPartition-method**: make heatmaps for consensus matrix and membership matrix with different number of subgroups.
- **collect_classes,ConsensusPartition-method**: make heatmap with subgroups with different numbers.
- **get_param,ConsensusPartition-method**: get parameters for the consensus clustering.
- **get_matrix,ConsensusPartition-method**: get the original matrix.
- **get_consensus,ConsensusPartition-method**: get the consensus matrix.
get_membership,ConsensusPartition-method: get the membership of partitions generated from random samplings.
get_stats,ConsensusPartition-method: get statistics for the consensus partitioning.
get_classes,ConsensusPartition-method: get the consensus subgroup labels and other columns.
suggest_best_k,ConsensusPartition-method: guess the best number of subgroups.
test_to_known_factors,ConsensusPartition-method: test correlation between predicted subgroups and known factors, if available.
cola_report,ConsensusPartition-method: generate a HTML report for the whole analysis.
functional_enrichment,ConsensusPartition-method: perform functional enrichment analysis on significant genes if rows in the matrix can be corresponded to genes.

Author(s)
Zuguang Gu <z.gu@dkfz.de>

Examples
# There is no example
NULL

ConsensusPartitionList-class

The ConsensusPartitionList class

Description
The ConsensusPartitionList class

Details
The object contains results from all combinations of top-value methods and partitioning methods.

Methods
The ConsensusPartitionList-class provides following methods:

run_all_consensus_partition_methods: constructor method.
top_rows_overlap,ConsensusPartitionList-method: plot the overlaps of top rows under different top-value methods.
top_rows_heatmap,ConsensusPartitionList-method: plot the heatmap of top rows under different top-value methods.
goal_classes,ConsensusPartitionList-method: get consensus subgroup labels merged from all methods.
goal_matrix,ConsensusPartitionList-method: get the original matrix.
get_stats, ConsensusPartitionList-method: get statistics for the partition for a specified k.
get_membership, ConsensusPartitionList-method: get consensus membership matrix summarized from all methods.
suggest_best_k, ConsensusPartitionList-method: guess the best number of subgroups for all methods.
collect_plots, ConsensusPartitionList-method: collect plots from all combinations of top-value methods and partitioning methods with choosing a plotting function.
collect_classes, ConsensusPartitionList-method: make a plot which contains predicted subgroups from all combinations of top-value methods and partitioning methods.
test_to_known_factors, ConsensusPartitionList-method: test correlation between predicted subgroups and known annotations, if provided.
functional_enrichment, ConsensusPartitionList-method: perform functional enrichment analysis on significant genes if rows in the matrix can be corresponded to genes.

Author(s)
Zuguang Gu <z.gu@dkfz.de>

consensus_heatmap - ConsensusPartition-method

Heatmap of the consensus matrix

Description
Heatmap of the consensus matrix

Usage
## S4 method for signature 'ConsensusPartition'
consensus_heatmap(object, k, internal = FALSE,
                    anno = object@anno, anno_col = get_anno_col(object),
                    show_row_names = FALSE, show_column_names = FALSE, row_names_gp = gpar(fontsize = 8),
                    simplify = FALSE, ...)
consensus_heatmap-ConsensusPartition-method

**Arguments**

- **object**: A `ConsensusPartition-class` object.
- **k**: Number of subgroups.
- **internal**: Used internally.
- **anno**: A data frame of annotations for the original matrix columns. By default it uses the annotations specified in `consensus_partition` or `run_all_consensus_partition_methods`.
- **anno_col**: A list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.
- **show_row_names**: Whether plot row names on the consensus heatmap (which are the column names in the original matrix)
- **show_column_names**: Whether show column names.
- **row_names_gp**: Graphics parameters for row names.
- **simplify**: Internally used.
- **...**: other arguments.

**Details**

For row i and column j in the consensus matrix, the value of corresponding x_ij is the probability of sample i and sample j being in the same group from all partitions.

There are following heatmaps from left to right:

- probability of the sample to stay in the corresponding group
- silhouette scores which measure the distance of an item to the second closest subgroups.
- predicted subgroups
- consensus matrix.
- more annotations if provided as anno

One thing that is very important to note is that since we already know the consensus subgroups from consensus partition, in the heatmap, only rows or columns within the group is clustered.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**See Also**

`membership_heatmap`, `ConsensusPartition-method`
Examples

data(golub_cola)
consensus_heatmap(golub_cola["ATC", "skmeans"], k = 3)

Description

Consensus partition

Usage

consensus_partition(data,
    top_value_method = "ATC",
    top_n = NULL,
    partition_method = "skmeans",
    max_k = 6,
    k = NULL,
    sample_by = "row",
    p_sampling = 0.8,
    partition_repeat = 50,
    partition_param = list(),
    anno = NULL,
    anno_col = NULL,
    scale_rows = NULL,
    verbose = TRUE,
    mc.cores = 1, cores = mc.cores,
    prefix = ",",
    .env = NULL,
    help = cola_opt$help)

Arguments

data A numeric matrix where subgroups are found by columns.

top_value_method A single top-value method. Available methods are in all_top_value_methods. Use register_top_value_methods to add a new top-value method.

top_n Number of rows with top values. The value can be a vector with length > 1. When n > 5000, the function only randomly sample 5000 rows from top n rows. If top_n is a vector, partition will be applied to every values in top_n and consensus partition is summarized from all partitions.

partition_method A single partitioning method. Available methods are in all_partition_methods. Use register_partition_methods to add a new partition method.
max_k: Maximal number of subgroups to try. The function will try for 2:max_k subgroups.
k: Alternatively, you can specify a vector k.
sample_by: Should randomly sample the matrix by rows or by columns?
p_sampling: Proportion of the submatrix which contains the top n rows to sample.
partition_repeat: Number of repeats for the random sampling.
partition_param: Parameters for the partition method which are passed to ... in a registered partitioning method. See register_partition_methods for detail.
anno: A data frame with known annotation of samples. The annotations will be plotted in heatmaps and the correlation to predicted subgroups will be tested.
anno_col: A list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.
scale_rows: Whether to scale rows. If it is TRUE, scaling method defined in register_partition_methods is used.
verbose: Whether print messages.
mc.cores: Multiple cores to use. This argument will be removed in future versions.
cores: Number of cores, or a cluster object returned by makeCluster.
prefix: Internally used.
.env: An environment, internally used.
help: Whether to print help messages.

Details

The function performs analysis in following steps:

• calculate scores for rows by top-value method,
• for each top_n value, take top n rows,
• randomly sample p_sampling rows from the top_n-row matrix and perform partitioning for partition_repeat times,
• collect partitions from all individual partitions and summarize a consensus partition.

Value

A ConsensusPartition-class object. Simply type object in the interactive R session to see which functions can be applied on it.

Author(s)

Zuguang Gu <z.gu@dkfz.de>
See Also

run_all_consensus_partition_methods runs consensus partitioning with multiple top-value methods and multiple partitioning methods.

Examples

```r
set.seed(123)

m = cbind(rbind(matrix(rnorm(20*20, mean = 1, sd = 0.5), nr = 20),
                   matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20),
                   matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20)),
                    rbind(matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20),
                          matrix(rnorm(20*20, mean = 1, sd = 0.5), nr = 20),
                          matrix(rnorm(20*20, mean = 0, sd = 0.5), nr = 20)),
                    rbind(matrix(rnorm(20*20, mean = 0.5, sd = 0.5), nr = 20),
                          matrix(rnorm(20*20, mean = 0.5, sd = 0.5), nr = 20),
                          matrix(rnorm(20*20, mean = 0.5, sd = 0.5), nr = 20)))

res = consensus_partition(m, partition_repeat = 10, top_n = c(10, 20, 50))
res
```

===

**consensus_partition_by_down_sampling**

*Consensus partitioning only with a subset of columns*

Description

Consensus partitioning only with a subset of columns

Usage

```r
consensus_partition_by_down_sampling(data,
          top_value_method = "ATC",
          top_n = NULL,
          partition_method = "skmeans",
          max_k = 6, k = NULL,
          subset = min(round(ncol(data)*0.2), 250),
          pre_select = TRUE,
          verbose = TRUE, prefix = "", anno = NULL, anno_col = NULL,
          predict_method = "centroid",
          dist_method = c("euclidean", "correlation", "cosine"),
          .env = NULL, .predict = TRUE, mc.cores = 1, cores = mc.cores, ...)
```

Arguments

- **data** A numeric matrix where subgroups are found by columns.
- **top_value_method** A single top-value method. Available methods are in `all_top_value_methods`. Use `register_top_value_methods` to add a new top-value method.
top_n  Number of rows with top values. The value can be a vector with length > 1.
When n > 5000, the function only randomly sample 5000 rows from top n rows.
If top_n is a vector, partition will be applied to every values in top_n and
consensus partition is summarized from all partitions.

partition_method
A single partitioning method. Available methods are in all_partition_methods.
Use register_partition_methods to add a new partition method.

max_k  Maximal number of subgroups to try. The function will try for 2:max_k sub-
groups

k  Alternatively, you can specify a vector k.

subset  Number of columns to randomly sample, or a vector of selected indices.

pre_select  Whether to pre-select by k-means.

verbose  Whether to print messages.

prefix  Internally used.

anno  Annotation data frame.

anno_col  Annotation colors.

predict_method  Method for predicting class labels. Possible values are "centroid", "svm" and
"randomForest".

dist_method  Method for predict the class for other columns.

.env  An environment, internally used.

.predict  Internally used.

mc.cores  Number of cores. This argument will be removed in future versions.

cores  Number of cores, or a cluster object returned by makeCluster.

...  All pass to consensus_partition.

Details

The function performs consensus partitioning only with a small subset of columns and the class of
other columns are predicted by predict_classes,ConsensusPartition-method.

Examples

```r
## Not run:
data(golub_cola)
m = get_matrix(golub_cola)
set.seed(123)
golub_cola_ds = consensus_partition_by_down_sampling(m, subset = 50,
anno = get_anno(golub_cola), anno_col = get_anno_col(golub_cola),
top_value_method = "SD", partition_method = "kmeans")
## End(Not run)
```
correspond_between_rankings

Correspond between a list of rankings

Description

Correspond between a list of rankings

Usage

```r
correspond_between_rankings(lt, top_n = length(lt[[1]]),
    col = cola_opt$color_set_1[1:length(lt)], ...)
```

Arguments

- `lt` A list of scores under different metrics.
- `top_n` Top n elements to show the correspondance.
- `col` A vector of colors for `lt`.
- `...` Pass to `correspond_between_two_rankings`.

Details

It makes plots for every pairwise comparison in `lt`.

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

```r
require(matrixStats)
mat = matrix(runif(1000), ncol = 10)
x1 = rowSds(mat)
x2 = rowMads(mat)
x3 = rowSds(mat)/rowMeans(mat)
correspond_between_rankings(lt = list(SD = x1, MAD = x2, CV = x3),
    top_n = 20, col = c("red", "blue", "green"))
```
correspond_between_two_rankings

Correspond two rankings

Description

Correspond two rankings

Usage

```
correspond_between_two_rankings(x1, x2, name1, name2,
col1 = 2, col2 = 3, top_n = round(0.25*length(x1)), transparency = 0.9,
pt_size = unit(1, "mm"), newpage = TRUE, ratio = c(1, 1, 1))
```

Arguments

- `x1`: A vector of scores calculated by one metric.
- `x2`: A vector of scores calculated by another metric.
- `name1`: Name of the first metric.
- `name2`: Name of the second metric.
- `col1`: Color for the first metric.
- `col2`: Color for the second metric.
- `top_n`: Top n elements to show the correspondance.
- `transparency`: Transparency of the connecting lines.
- `pt_size`: Size of the points, must be a `unit` object.
- `newpage`: Whether to plot in a new graphic page.
- `ratio`: Ratio of width of the left barplot, connection lines and right barplot. The three values will be scaled to a sum of 1.

Details

In `x1` and `x2`, the i\textsuperscript{th} element in both vectors corresponds to the same object (e.g. same row if they are calculated from a matrix) but with different scores under different metrics.

`x1` and `x2` are sorted in the left panel and right panel respectively. The top n elements under corresponding metric are highlighted by vertical colored lines in both panels. The left and right panels also shown as barplots of the scores in the two metrics. Between the left and right panels, there are lines connecting the same element (e.g. i\textsuperscript{th} element in `x1` and `x2`) in the two ordered vectors so that you can see how a same element has two different ranks in the two metrics.

Under the plot is a simple Venn diagram showing the overlaps of the top n elements by the two metrics.

Value

No value is returned.
david_enrichment

Author(s)
Zuguang Gu <z.gu@dkfz.de>

See Also
correspond_between_rankings draws for more than 2 sets of rankings.

Examples
require(matrixStats)
mat = matrix(runif(1000), ncol = 10)
x1 = rowSds(mat)
x2 = rowMads(mat)
correspond_between_two_rankings(x1, x2, name1 = "SD", name2 = "MAD", top_n = 20)

david_enrichment Perform DAVID enrichment analysis

Description
Perform DAVID enrichment analysis

Usage
david_enrichment(genes, email,
catalog = c("GOTERM_CC_FAT", "GOTERM_BP_FAT", "GOTERM_MF_FAT", "KEGG_PATHWAY"),
idtype = "ENSEMBL_GENE_ID", species = "Homo sapiens")

Arguments
genes A vector of gene identifiers.
email The email that user registered on DAVID web service (https://david.ncifcrf.gov/content.jsp?file=WS.html).
catalog A vector of function catalogs. Valid values should be in cola:::DAVID_ALL_CATALOGS.
idtype ID types for the input gene list. Valid values should be in cola:::DAVID_ALL_ID_TYPES.
species Full species name if the ID type is not uniquely mapped to one single species.

Details
This function directly sends the HTTP request to DAVID web service (https://david.ncifcrf.gov/content.jsp?file=WS.html) and parses the returned XML. The reason of writing this function is I have problems with other R packages doing DAVID analysis (e.g. RDAVIDWebService, https://bioconductor.org/packages/devel/bioc/html/RDAVIDWebService.html) because the rJava package RDAVIDWebService depends on can not be installed on my machine.

Users are encouraged to use more advanced gene set enrichment tools such as clusterProfiler (http://www.bioconductor.org/packages/release/bioc/html/clusterProfiler.html), or fgsea (http://www.bioconductor.org/packages/release/bioc/html/fgsea.html). If you want to run this function multiple times, please set time intervals between runs.
dim.ConsensusPartition

Value
A data frame with functional enrichment results.

Author(s)
Zuguang Gu <z.gu@dkfz.de>

See Also
Now cola has a replacement function functional_enrichment to perform enrichment analysis.

**dim.ConsensusPartition**

*Dimension of the matrix*

---

Description
Dimension of the matrix

Usage
```r
# S3 method for class 'ConsensusPartition'

dim(x)
```

Arguments

- `x` A `ConsensusPartition-class` object.

Examples
# There is no example
NULL
### dim.ConsensusPartitionList

#### Dimension of the matrix

**Description**

Dimension of the matrix

**Usage**

```r
## S3 method for class 'ConsensusPartitionList'
dim(x)
```

**Arguments**

- `x` A `ConsensusPartitionList`-class object.

**Examples**

```r
# There is no example
NULL
```

---

### dim.DownSamplingConsensusPartition

#### Dimension of the matrix

**Description**

Dimension of the matrix

**Usage**

```r
## S3 method for class 'DownSamplingConsensusPartition'
dim(x)
```

**Arguments**

- `x` A `DownSamplingConsensusPartition`-class object.

**Examples**

```r
# There is no example
NULL
```
### dim.HierarchicalPartition

**Dimension of the matrix**

**Description**

Dimension of the matrix

**Usage**

```r
## S3 method for class 'HierarchicalPartition'
dim(x)
```

**Arguments**

- `x` A `HierarchicalPartition-class` object.

**Examples**

```r
# There is no example
NULL
```

---

### dimension_reduction-ConsensusPartition-method

**Visualize column after dimension reduction**

**Description**

Visualize samples (the matrix columns) after dimension reduction

**Usage**

```r
## S4 method for signature 'ConsensusPartition'
dimension_reduction(object, k, top_n = NULL,
method = c("PCA", "MDS", "t-SNE", "UMAP"),
control = list(), color_by = NULL,
internal = FALSE, nr = 5000,
silhouette_cutoff = 0.5, remove = FALSE,
scale_rows = object@scale_rows, verbose = TRUE, ...)
```

---
Arguments

object   A ConsensusPartition-class object.
k      Number of subgroups.
top_n   Top n rows to use. By default it uses all rows in the original matrix.
method   Which method to reduce the dimension of the data. MDS uses cmdscale, PCA uses prcomp. t-SNE uses Rtsne. UMAP uses umap.
color_by   If annotation table is set, an annotation name can be set here.
control   A list of parameters for Rtsne or umap.
internal   Internally used.
nr      If number of matrix rows is larger than this value, random nr rows are used.
silhouette_cutoff   Cutoff of silhouette score. Data points with values less than it will be mapped with cross symbols.
remove   Whether to remove columns which have less silhouette scores than the cutoff.
scale_rows   Whether to perform scaling on matrix rows.
verbose   Whether print messages.
...   Pass to dimension_reduction, matrix-method.

Value

Locations of the points.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

data(golub_cola)
dimension_reduction(golub_cola["ATC", "skmeans"], k = 3)

Method dispatch page for dimension_reduction.
Dispatch

dimension_reduction can be dispatched on following classes:

- dimension_reduction,ConsensusPartition-method, ConsensusPartition-class class method
- dimension_reduction,DownSamplingConsensusPartition-method, DownSamplingConsensusPartition-class class method
- dimension_reduction,HierarchicalPartition-method, HierarchicalPartition-class class method
- dimension_reduction,matrix-method, matrix-class class method

Examples

```r
# no example
NULL
```

---

**dimension_reduction-DownSamplingConsensusPartition-method**

*Visualize column after dimension reduction*

Description

Visualize samples (the matrix columns) after dimension reduction

Usage

```r
## S4 method for signature 'DownSamplingConsensusPartition'
dimension_reduction(object, k, top_n = NULL,
                    method = c("PCA", "MDS", "t-SNE", "UMAP"),
                    control = list(), color_by = NULL,
                    internal = FALSE, nr = 5000,
                    p_cutoff = 0.05, remove = FALSE,
                    scale_rows = TRUE, verbose = TRUE, ...)
```

Arguments

- `object`: A `DownSamplingConsensusPartition-class` object.
- `k`: Number of subgroups.
- `top_n`: Top n rows to use. By default it uses all rows in the original matrix.
- `method`: Which method to reduce the dimension of the data. MDS uses `cmdscale`, PCA uses `prcomp`. t-SNE uses `Rtsne`. UMAP uses `umap`.
- `color_by`: If annotation table is set, an annotation name can be set here.
- `control`: A list of parameters for `Rtsne` or `umap`. 
Details

This function is basically very similar as `dimension_reduction,ConsensusPartition-method`.

Value

No value is returned.

Examples

```r
data(golub_cola_ds)
dimension_reduction(golub_cola_ds, k = 2)
dimension_reduction(golub_cola_ds, k = 3)
```

## S4 method for signature 'HierarchicalPartition'

```r
dimension_reduction(object, merge_node = merge_node_param(),
                   parent_node, top_n = NULL, top_value_method = object@list[[1]]@top_value_method,
                   method = c("PCA", "MDS", "t-SNE", "UMAP"), color_by = NULL,
                   scale_rows = object@list[[1]]@scale_rows, verbose = TRUE, ...)
```

Arguments

- `merge_node`: Parameters to merge sub-dendrograms, see `merge_node_param`.
- `top_n`: Top n rows to use. By default it uses all rows in the original matrix.
- `top_value_method`: Which top-value method to use.
parent_node Parent node. If it is set, the function call is identical to \texttt{dimension_reduction(object[parent_node])}.

method Which method to reduce the dimension of the data. MDS uses \texttt{cmdscale}, PCA uses \texttt{prcomp}, t-SNE uses \texttt{Rtsne}, UMAP uses \texttt{umap}.

color_by If annotation table is set, an annotation name can be set here.

scale_rows Whether to perform scaling on matrix rows.

verbose Whether print messages.

\ldots Other arguments passed to \texttt{dimension_reduction, ConsensusPartition-method}.

Details

The class IDs are extract at depth.

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

\begin{verbatim}
data(golub_cola_rh)
dimension_reduction(golub_cola_rh)
\end{verbatim}

\section*{Description}

\begin{verbatim}
Visualize columns after dimension reduction
\end{verbatim}

Usage

\begin{verbatim}
## S4 method for signature 'matrix'
dimension_reduction(object, pch = 16, col = "black", cex = 1, main = NULL, method = c("PCA", "MDS", "t-SNE", "UMAP"), pc = NULL, control = list(), scale_rows = FALSE, nr = 5000, internal = FALSE, verbose = TRUE)
\end{verbatim}
### Arguments

- **object**: A numeric matrix.
- **method**: Which method to reduce the dimension of the data. MDS uses `cmdscale`, PCA uses `prcomp`, t-SNE uses `Rtsne`, UMAP uses `umap`.
- **pc**: Which two principle components to visualize.
- **control**: A list of parameters for `Rtsne` or `umap`.
- **pch**: Shape of points.
- **col**: Color of points.
- **cex**: Size of points.
- **main**: Title of the plot.
- **scale_rows**: Whether perform scaling on matrix rows.
- **nr**: If number of matrix rows is larger than this value, random `nr` rows are used.
- **internal**: Internally used.
- **verbose**: Whether print messages.

### Value

Locations of the points.

### Author(s)

Zuguang Gu <z.gu@dkfz.de>

### Examples

```r
# There is no example
NULL
```

### Description

The `DownSamplingConsensusPartition-class`

### Details

The `DownSamplingConsensusPartition` performs consensus partitioning only with a small subset of columns and the class of other columns are predicted by `predict_classes,ConsensusPartition-method`. The `DownSamplingConsensusPartition-class` is a child class of `ConsensusPartition-class`. It inherits all methods of `ConsensusPartition-class`. 
See Also

The constructor function `consensus_partition_by_down_sampling`.

Examples

```R
# There is no example
NULL
```

---

**FCC**  
*Flatness of the CDF curve*

Description

Flatness of the CDF curve

Usage

```R
FCC(consensus_mat, diff = 0.1)
```

Arguments

- `consensus_mat`: A consensus matrix.
- `diff`: Difference of F(b) - F(a).

Details

For a in [0, 0.5] and for b in [0.5, 1], the flatness measures the flatness of the CDF curve of the consensus matrix. It is calculated as the maximum width that fits F(b) - F(a) <= diff.

Value

A numeric value.

Examples

```R
data(golub_cola)
FCC(get_consensus(golub_cola[1, 1], k = 2))
FCC(get_consensus(golub_cola[1, 1], k = 3))
FCC(get_consensus(golub_cola[1, 1], k = 4))
FCC(get_consensus(golub_cola[1, 1], k = 5))
FCC(get_consensus(golub_cola[1, 1], k = 6))
```
**find_best_km**

*Find a best k for the k-means clustering*

**Description**
Find a best k for the k-means clustering

**Usage**
```r
find_best_km(mat, max_km = 15)
```

**Arguments**
- `mat`: A matrix where k-means clustering is executed by rows.
- `max_km`: Maximal k to try.

**Details**
The best k is determined by looking for the knee/elbow of the WSS curve (within-cluster sum of square).
Note this function is only for a rough and quick estimation of the best k.

**Examples**
```r
# There is no example
NULL
```

---

**functional_enrichment-ANY-method**

*Perform functional enrichment on signature genes*

**Description**
Perform functional enrichment on signature genes

**Usage**
```r
## S4 method for signature 'ANY'
functional_enrichment(object, 
id_mapping = guess_id_mapping(object, org_db, verbose), 
org_db = "org.Hs.eg.db", ontology = "BP", 
min_set_size = 10, max_set_size = 1000, 
verbose = TRUE, prefix = "", ...)
```

---
Arguments

object A vector of gene IDs.

id_mapping If the gene IDs are not Entrez IDs, a named vector should be provided where the names are the gene IDs and values are the corresponding Entrez IDs. The value can also be a function that converts gene IDs.

org_db Annotation database.

ontology Following ontologies are allowed: BP, CC, MF, KEGG, Reactome. MSigDb with the gmt file set by gmt_file argument, or gmt for general gmt gene sets.

min_set_size The minimal size of the gene sets.

max_set_size The maximal size of the gene sets.

verbose Whether to print messages.

prefix Used internally.

... Pass to enrichGO, enrichKEGG, enricher, enrichDO or enrichPathway.

Details

The function enrichment is applied by clusterProfiler, DOSE or ReactomePA packages.

Value

A data frame.

Examples

# There is no example
NULL
Usage

```r
## S4 method for signature 'ConsensusPartition'
functional_enrichment(object, gene_fdr_cutoff = cola_opt$fdr_cutoff, k = suggest_best_k(object, help = FALSE),
                        row_km = NULL, id_mapping = guess_id_mapping(rownames(object), org_db, verbose),
                        org_db = "org.Hs.eg.db", ontology = "BP",
                        min_set_size = 10, max_set_size = 1000,
                        verbose = TRUE, prefix = "", ...)
```

Arguments

- `object`: a `ConsensusPartition-class` object from `run_all_consensus_partition_methods`.
- `gene_fdr_cutoff`: Cutoff of FDR to define significant signature genes.
- `k`: Number of subgroups.
- `row_km`: Number of row clusterings by k-means to separate the matrix that only contains signatures.
- `id_mapping`: If the gene IDs which are row names of the original matrix are not Entrez IDs, a named vector should be provided where the names are the gene IDs in the matrix and values are corresponding Entrez IDs. The value can also be a function that converts gene IDs.
- `org_db`: Annotation database.
- `ontology`: See corresponding argument in `functional_enrichment,ANY-method`.
- `min_set_size`: The minimal size of the gene sets.
- `max_set_size`: The maximal size of the gene sets.
- `verbose`: Whether to print messages.
- `prefix`: Used internally.
- `...`: Pass to `functional_enrichment,ANY-method`.

Details

For how to control the parameters of functional enrichment, see help page of `functional_enrichment,ANY-method`.

Value

A list of data frames which correspond to results for the functional ontologies:

See Also

Examples

```r
# There is no example
NULL
```
**Description**

Perform functional enrichment on signature genes

**Usage**

```r
## S4 method for signature 'ConsensusPartitionList'
functional_enrichment(object, gene_fdr_cutoff = cola_opt$fdr_cutoff,
                        id_mapping = guess_id_mapping(rownames(object), org_db, FALSE),
                        org_db = "org.Hs.eg.db", ontology = "BP",
                        min_set_size = 10, max_set_size = 1000, ...)
```

**Arguments**

- `object`: A `ConsensusPartitionList-class` object from `run_all_consensus_partition_methods`
- `gene_fdr_cutoff`: Cutoff of FDR to define significant signature genes.
- `id_mapping`: If the gene IDs which are row names of the original matrix are not Entrez IDs, a named vector should be provided where the names are the gene IDs in the matrix and values are corresponding Entrez IDs. The value can also be a function that converts gene IDs.
- `org_db`: Annotation database.
- `ontology`: See corresponding argument in `functional_enrichment,ANY-method`.
- `min_set_size`: The minimal size of the gene sets.
- `max_set_size`: The maximal size of the gene sets.
- `...`: Pass to `functional_enrichment,ANY-method`.

**Details**

For each method, the signature genes are extracted based on the best k.

It calls `functional_enrichment,ConsensusPartition-method` on the consensus partitioning results for each method.

For how to control the parameters of functional enrichment, see help page of `functional_enrichment,ANY-method`.

**Value**

A list where each element in the list corresponds to enrichment results from a single method.

**functional_enrichment-HierarchicalPartition-method**

*Perform functional enrichment on signature genes*

---

**Description**

Perform functional enrichment on signature genes
### Usage

```r
## S4 method for signature 'HierarchicalPartition'
functional_enrichment(object, merge_node = merge_node_param(),
gene_fdr_cutoff = cola_opt$fdr_cutoff,
row_km = NULL, id_mapping = guess_id_mapping(rownames(object), org_db, verbose),
org_db = "org.Hs.eg.db", ontology = "BP",
min_set_size = 10, max_set_size = 1000,
verbose = TRUE, ...)  
```

### Arguments

- `object` a `HierarchicalPartition-class` object from `hierarchical_partition`.
- `merge_node` Parameters to merge sub-dendrograms, see `merge_node_param`.
- `gene_fdr_cutoff` Cutoff of FDR to define significant signature genes.
- `row_km` Number of row clusterings by k-means to separate the matrix that only contains signatures.
- `id_mapping` If the gene IDs which are row names of the original matrix are not Entrez IDs, a named vector should be provided where the names are the gene IDs in the matrix and values are corresponding Entrez IDs. The value can also be a function that converts gene IDs.
- `org_db` Annotation database.
- `ontology` See corresponding argument in `functional_enrichment,ANY-method`.
- `min_set_size` The minimal size of the gene sets.
- `max_set_size` The maximal size of the gene sets.
- `verbose` Whether to print messages.
- `...` Pass to `functional_enrichment,ANY-method`.

### Details

For how to control the parameters of functional enrichment, see help page of `functional_enrichment,ANY-method`.

### Value

A list of data frames which correspond to results for the functional ontologies:

Description

Method dispatch page for get_anno_col.

Dispatch

get_anno_col can be dispatched on following classes:

- get_anno_col,HierarchicalPartition-method,HierarchicalPartition-class class method
- get_anno_col,ConsensusPartitionList-method,ConsensusPartitionList-class class method
- get_anno_col,ConsensusPartition-method,ConsensusPartition-class class method
get_anno_col-HierarchicalPartition-method

**Description**

Get annotation colors

**Usage**

```r
## S4 method for signature 'HierarchicalPartition'
get_anno_col(object)
```

**Arguments**

- `object` A `HierarchicalPartition-class` object.

**Value**

A list of color vectors or NULL.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```r
# There is no example
NULL
```
**get_children_nodes-HierarchicalPartition-method**

Test whether a node is a leaf node

**Description**

Test whether a node is a leaf node

**Usage**

```r
## S4 method for signature 'HierarchicalPartition'
get_children_nodes(object, node, merge_node = merge_node_param())
```

**Arguments**

- `node`: A vector of node IDs.
- `merge_node`: Parameters to merge sub-dendrograms, see `merge_node_param`.

**Value**

A vector of children nodes.

**Examples**

```r
# There is no example
NULL
```

**get_classes-ConsensusPartition-method**

Get subgroup labels

**Description**

Get subgroup labels

**Usage**

```r
## S4 method for signature 'ConsensusPartition'
get_classes(object, k = object@k)
```

**Arguments**

- `k`: Number of subgroups.
Value

A data frame with subgroup labels and other columns which are entropy of the percent membership matrix and the silhouette scores which measure the stability of a sample to stay in its group.

If \( k \) is not specified, it returns a data frame with subgroup labels from all \( k \).

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

data(golub_cola)
obj = golub_cola["ATC", "skmeans"]
get_classes(obj, k = 2)
get_classes(obj)

Description

Get subgroup labels

Usage

## S4 method for signature 'ConsensusPartitionList'
get_classes(object, k)

Arguments

- object: A ConsensusPartitionList-class object.
- \( k \): Number of subgroups.

Details

The subgroup labels are inferred by merging partitions from all methods by weighting the mean silhouette scores in each method.

Value

A data frame with subgroup labels and other columns which are entropy of the percent membership matrix and the silhouette scores which measure the stability of a sample to stay in its group.

Author(s)

Zuguang Gu <z.gu@dkfz.de>
get_classes-dispatch

Examples

```r
data(golub_cola)
get_classes(golub_cola, k = 2)
```

get_classes-dispatch  Method dispatch page for get_classes

Description

Method dispatch page for get_classes.

Dispatch

get_classes can be dispatched on following classes:

- `get_classes,HierarchicalPartition-method`, `HierarchicalPartition-class` class method
- `get_classes,ConsensusPartitionList-method`, `ConsensusPartitionList-class` class method
- `get_classes,ConsensusPartition-method`, `ConsensusPartition-class` class method
- `get_classes,DownSamplingConsensusPartition-method`, `DownSamplingConsensusPartition-class` class method

Examples

```r
# no example
NULL
```

get_classes-DownSamplingConsensusPartition-method

Get subgroup labels

Description

Get subgroup labels

Usage

```r
## S4 method for signature 'DownSamplingConsensusPartition'
get_classes(object, k = object@k, p_cutoff = 0.05, reduce = FALSE)
```
get_classes-HierarchicalPartition-method

Arguments

- **object**: A `DownSamplingConsensusPartition-class` object.
- **k**: Number of subgroups.
- **p_cutoff**: Cutoff of p-values of class label prediction. It is only used when `k` is a vector.
- **reduce**: Used internally.

Value

If `k` is a scalar, it returns a data frame with two columns:

- the class labels
- the p-value for the prediction of class labels.

If `k` is a vector, it returns a data frame of class labels for each `k`. The class label with prediction p-value > `p_cutoff` is set to NA.

Examples

```r
data(golub_cola_ds)
get_classes(golub_cola_ds, k = 3)
get_classes(golub_cola_ds)
```

Description

Get class IDs from the `HierarchicalPartition` object

Usage

```r
## S4 method for signature 'HierarchicalPartition'
get_classes(object, merge_node = merge_node_param())
```

Arguments

- **object**: A `HierarchicalPartition-class` object.
- **merge_node**: Parameters to merge sub-dendrograms, see `merge_node_param`.

Value

A data frame of classes IDs. The class IDs are the node IDs where the subgroup sits in the hierarchy.

Author(s)

Zuguang Gu <z.gu@dkfz.de>
**get_consensus**-ConsensusPartition-method

**Description**

Get consensus matrix

**Usage**

```r
## S4 method for signature 'ConsensusPartition'
get_consensus(object, k)
```

**Arguments**

- `k`: Number of subgroups.

**Details**

For row i and column j in the consensus matrix, the value of corresponding x_ij is the probability of sample i and sample j being in the same group from all partitions.

**Value**

A consensus matrix corresponding to the current k.

**Examples**

```r
data(golub_cola)
obj = golub_cola["ATC", "skmeans"]
get_consensus(obj, k = 2)
```
get_matrix-ConsensusPartition-method

Get the original matrix

Description
Get the original matrix

Usage

## S4 method for signature 'ConsensusPartition'
get_matrix(object, full = FALSE, include_all_rows = FALSE)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>A ConsensusPartition-class object.</td>
</tr>
<tr>
<td>full</td>
<td>Whether to extract the complete original matrix.</td>
</tr>
<tr>
<td>include_all_rows</td>
<td>Internally used.</td>
</tr>
</tbody>
</table>

Value
A numeric matrix.

Author(s)
Zuguang Gu <z.gu@dkfz.de>

Examples

data(golub_cola)
obj = golub_cola["ATC", "skmeans"]
get_matrix(obj)

get_matrix-ConsensusPartitionList-method

Get the original matrix

Description
Get the original matrix

Usage

## S4 method for signature 'ConsensusPartitionList'
get_matrix(object)
get_matrix-dispatch

Arguments

object  A ConsensusPartitionList-class object.

Value

A numeric matrix.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

data(golub_cola)
get_matrix(golub_cola)

Description

Method dispatch page for get_matrix.

Dispatch

get_matrix can be dispatched on following classes:

- get_matrix,ConsensusPartition-method,ConsensusPartition-class class method
- get_matrix,ConsensusPartitionList-method,ConsensusPartitionList-class class method
- get_matrix,DownSamplingConsensusPartition-method,DownSamplingConsensusPartition-class class method
- get_matrix,HierarchicalPartition-method,HierarchicalPartition-class class method

Examples

# no example
NULL
get_matrix-DownSamplingConsensusPartition-method

Get the original matrix

Description

Get the original matrix

Usage

## S4 method for signature 'DownSamplingConsensusPartition'
get_matrix(object, reduce = FALSE)

Arguments

object A \texttt{DownSamplingConsensusPartition-class} object.
reduce Whether to return the reduced matrix where columns are randomly sampled.

Value

A numeric matrix

Examples

# There is no example
NULL

get_matrix-HierarchicalPartition-method

Get the original matrix

Description

Get the original matrix

Usage

## S4 method for signature 'HierarchicalPartition'
get_matrix(object)

Arguments

object A \texttt{HierarchicalPartition-class} object.
**Value**

A numeric matrix.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```r
# There is no example
NULL
```

---

**Description**

Get membership matrix

**Usage**

```r
## S4 method for signature 'ConsensusPartition'
get_membership(object, k, each = FALSE)
```

**Arguments**

- `k`: Number of subgroups.
- `each`: Whether to return the percentage membership matrix which is summarized from all partitions or the individual membership in every single partition run.

**Details**

If `each == FALSE`, the value in the membership matrix is the probability to be in one subgroup, while if `each == TRUE`, the membership matrix contains the subgroup labels for every single partitions which are from randomly sampling from the original matrix. The percent membership matrix is calculated by `cl_consensus`.

**Value**

- If `each == FALSE`, it returns a membership matrix where rows correspond to the columns from the subgroups.
- If `each == TRUE`, it returns a membership matrix where rows correspond to the columns from the original matrix.
Author(s)

Zuguang Gu <z.gu@dkfz.de>

See Also

get_membership, ConsensusPartitionList-method summarizes membership from partitions from all combinations of top-value methods and partitioning methods.

Examples

```r
data(golub_cola)
obj = golub_cola["ATC", "skmeans"]
get_membership(obj, k = 2)
get_membership(obj, k = 2, each = TRUE)
```

Description

Get membership matrix

Usage

```r
## S4 method for signature 'ConsensusPartitionList'
get_membership(object, k)
```

Arguments

- `object`: A ConsensusPartitionList-class object.
- `k`: Number of subgroups.

Details

The membership matrix (the probability of each sample to be in one subgroup, if assuming columns represent samples) is inferred from the consensus partition of every combination of methods, weighted by the mean silhouette score of the partition for each method. So methods which give unstable partitions have lower weights when summarizing membership matrix from all methods.

Value

A membership matrix where rows correspond to the columns in the original matrix.

Author(s)

Zuguang Gu <z.gu@dkfz.de>
get_membership-dispatch

See Also
get_membership, ConsensusPartition-method returns membership matrix for a single top-value method and partitioning method.

Examples
data(golub_cola)
get_membership(golub_cola, k = 2)

get_membership-dispatch

Method dispatch page for get_membership

Description
Method dispatch page for get_membership.

Dispatch
get_membership can be dispatched on following classes:

- get_membership, ConsensusPartition-method, ConsensusPartition-class class method
- get_membership, ConsensusPartitionList-method, ConsensusPartitionList-class class method

Examples
# no example
NULL

get_param-ConsensusPartition-method

Get parameters

Description
Get parameters

Usage
## S4 method for signature 'ConsensusPartition'
get_param(object, k = object@k, unique = TRUE)
Arguments

- **object**: A `ConsensusPartition-class` object.
- **k**: Number of subgroups.
- **unique**: Whether to apply `unique` to rows of the returned data frame.

Details

It is mainly used internally.

Value

A data frame of parameters corresponding to the current `k`. In the data frame, each row corresponds to a partition run.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

```r
data(golub_cola)
obj = golub_cola["ATC", "skmeans"]
get_param(obj)
get_param(obj, k = 2)
get_param(obj, unique = FALSE)
```

Description

Get signature rows

Usage

```r
## S4 method for signature 'ConsensusPartition'
get_signatures(object, k,
    col = if(scale_rows) c("green", "white", "red") else c("blue", "white", "red"),
    silhouette_cutoff = 0.5,
    fdr_cutoff = cola_opt$fdr_cutoff,
    top_signatures = NULL,
    group_diff = cola_opt$group_diff,
    scale_rows = object@scale_rows, .scale_mean = NULL, .scale_sd = NULL,
    row_km = NULL,
    diff_method = c("Ftest", "ttest", "samr", "pamr", "one_vs_others", "uniquely_high_in_one_group"),
    anno = get_anno(object),
```
arguments

- **object**: A `ConsensusPartition-class` object.
- **k**: Number of subgroups.
- **col**: Colors for the main heatmap.
- **silhouette_cutoff**: Cutoff for silhouette scores. Samples with values less than it are not used for finding signature rows. For selecting a proper silhouette cutoff, please refer to [https://www.stat.berkeley.edu/~s133/Cluster2a.html#tth_tAb1](https://www.stat.berkeley.edu/~s133/Cluster2a.html#tth_tAb1).
- **fdr_cutoff**: Cutoff for FDR of the difference test between subgroups.
- **top_signatures**: Top signatures with most significant fdr. Note since fdr might be same for multiple rows, the final number of signatures might not be exactly the same as the one that has been set.
- **group_diff**: Cutoff for the maximal difference between group means.
- **scale_rows**: Whether apply row scaling when making the heatmap.
- **.scale_mean**: Internally used.
- **.scale_sd**: Internally used.
- **row_km**: Number of groups for performing k-means clustering on rows. By default it is automatically selected.
- **diff_method**: Methods to get rows which are significantly different between subgroups, see 'Details' section.
- **anno**: A data frame of annotations for the original matrix columns. By default it uses the annotations specified in `consensus_partition` or `run_all_consensus_partition_methods`.
- **anno_col**: A list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.
- **internal**: Used internally.
- **show_row_dend**: Whether show row dendrogram.
- **show_column_names**: Whether show column names in the heatmap.
- **column_names_gp**: Graphics parameters for column names.
- **use_raster**: Internally used.
plot  Whether to make the plot.
verbose Whether to print messages.
seed Random seed.
left_annotation Annotation put on the left of the heatmap. It should be a `HeatmapAnnotation-class` object. The number of items should be the same as the number of the original matrix rows. The subsetting to the significant rows are automatically performed on the annotation object.
right_annotation Annotation put on the right of the heatmap. Same format as `left_annotation`.
simplify Only used internally.
prefix Only used internally.
enforce The analysis is cached by default, so that the analysis with the same input will be automatically extracted without rerunning them. Set `enforce` to `TRUE` to enforce the function to re-perform the analysis.
hash Userd internally.
from_hc Is the `ConsensusPartition-class` object a node of a `HierarchicalPartition` object?
... Other arguments.

Details

Basically the function applies statistical test for the difference in subgroups for every row. There are following methods which test significance of the difference:

- **ttest** First it looks for the subgroup with highest mean value, compare to each of the other subgroups with t-test and take the maximum p-value. Second it looks for the subgroup with lowest mean value, compare to each of the other subgroups again with t-test and take the maximum p-values. Later for these two list of p-values take the minimal p-value as the final p-value.

- **samr/pamr** use SAM (from samr package)/PAM (from pamr package) method to find significantly different rows between subgroups.

- **Ftest** use F-test to find significantly different rows between subgroups.

- **one_vs_others** For each subgroup i in each row, it uses t-test to compare samples in current subgroup to all other samples, denoted as p_i. The p-value for current row is selected as min(p_i).

- **uniquely_high_in_one_group** The signatures are defined as, if they are uniquely up-regulated in subgroup A, then it must fit following criterions: 1. in a two-group t-test of A ~ other_merged_groups, the statistic must be > 0 (high in group A) and p-value must be significant, and 2. for other groups (excluding A), t-test in every pair of groups should not be significant.

diff_method can also be a self-defined function. The function needs two arguments which are the matrix for the analysis and the predicted classes. The function should returns a vector of FDR from the difference test.
Value

A data frame with more than two columns:

which_row: row index corresponding to the original matrix.
fdr: the FDR.
km: the k-means groups if row_km is set.
other_columns: the mean value (depending rows are scaled or not) in each subgroup.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

data(golub_cola)
res = golub_cola["ATC", "skmeans"]
tb = get_signatures(res, k = 3)
head(tb)
get_signatures(res, k = 3, top_signatures = 100)

Description

Method dispatch page for get_signatures.

Dispatch

get_signatures can be dispatched on following classes:

- get_signatures,ConsensusPartition-method,ConsensusPartition-class class method
- get_signatures,DownSamplingConsensusPartition-method,DownSamplingConsensusPartition-class class method
- get_signatures,HierarchicalPartition-method,HierarchicalPartition-class class method

Examples

# no example
NULL
get_signatures-DownSamplingConsensusPartition-method

Get signature rows

Description
Get signature rows

Usage

```r
## S4 method for signature 'DownSamplingConsensusPartition'
get_signatures(object, k,
p_cutoff = 1, ...)
```

Arguments

- `object`: A `DownSamplingConsensusPartition-class` object.
- `k`: Number of subgroups.
- `p_cutoff`: Cutoff for p-values of class label prediction. Samples with values higher than it are not used for finding signature rows.
- `...`: Other arguments passed to `get_signatures,ConsensusPartition-method`.

Details
This function is very similar as `get_signatures,ConsensusPartition-method`.

Examples

```r
data(golub_cola_ds)
get_signatures(golub_cola_ds, k = 2)
get_signatures(golub_cola_ds, k = 3)
```

get_signatures-HierarchicalPartition-method

Get signatures rows

Description
Get signatures rows
get_signatures-HierarchicalPartition-method

Usage

```r
## S4 method for signature 'HierarchicalPartition'
get_signatures(object, merge_node = merge_node_param(),
group_diff = object@param$group_diff,
row_km = NULL, diff_method = "Ftest", fdr_cutoff = object@param$fdr_cutoff,
scale_rows = object[1]@scale_rows,
anno = get_anno(object),
anno_col = get_anno_col(object),
show_column_names = FALSE, column_names_gp = gpar(fontsize = 8),
verbose = TRUE, plot = TRUE, seed = 888,
...)
```

Arguments

- **object**: a `HierarchicalPartition-class` object.
- **merge_node**: Parameters to merge sub-dendrograms, see `merge_node_param`.
- **group_diff**: Cutoff for the maximal difference between group means.
- **row_km**: Number of groups for performing k-means clustering on rows. By default it is automatically selected.
- **diff_method**: Methods to get rows which are significantly different between subgroups.
- **fdr_cutoff**: Cutoff for FDR of the difference test between subgroups.
- **scale_rows**: whether apply row scaling when making the heatmap.
- **anno**: a data frame of annotations for the original matrix columns. By default it uses the annotations specified in `hierarchical_partition`.
- **anno_col**: a list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.
- **show_column_names**: whether show column names in the heatmap.
- **column_names_gp**: Graphic parameters for column names.
- **verbose**: whether to print messages.
- **plot**: whether to make the plot.
- **seed**: Random seed.
- **...**: other arguments pass to `get_signatures,ConsensusPartition-method`.

Details

The function calls `get_signatures,ConsensusPartition-method` to find signatures at each node of the partition hierarchy.
Value

A data frame with more than two columns:

\texttt{which\_row}: row index corresponding to the original matrix.

\texttt{km}: the k-means groups if \texttt{row\_km} is set.

**other\_columns**: the mean value (depending rows are scaled or not) in each subgroup.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

data(golub\_cola\_rh)
\texttt{tb} = get\_signatures(golub\_cola\_rh)
\texttt{head(tb)}

Description

Get statistics

Usage

```r
## S4 method for signature 'ConsensusPartition'
get_stats(object, k = object@k, all_stats = FALSE)
```

Arguments

- **object**: A ConsensusPartition-class object.
- **k**: Number of subgroups. The value can be a vector.
- **all_stats**: Whether to show all statistics that were calculated. Used internally.

Details

The statistics are:

**1-PAC** 1 - proportion of ambiguous clustering, calculated by \texttt{PAC}.

**mean\_silhouette** The mean silhouette score. See \url{https://en.wikipedia.org/wiki/Silhouette_(clustering)}.

**concordance** The mean probability that each partition fits the consensus partition, calculated by \texttt{concordance}. 
area_increased The increased area under eCDF (the empirical cumulative distribution function) curve to the previous k.

Rand This is the percent of pairs of samples that are both in a same cluster or both are not in a same cluster in the partition of k and k-1. See https://en.wikipedia.org/wiki/Rand_index.

Jaccard The ratio of pairs of samples are both in a same cluster in the partition of k and k-1 and the pairs of samples are both in a same cluster in the partition k or k-1.

Value

A matrix of partition statistics.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

data(golub_cola)
obj = golub_cola["ATC", "skmeans"]
get_stats(obj)
get_stats(obj, k = 2)

Description

Get statistics

Usage

## S4 method for signature 'ConsensusPartitionList'
get_stats(object, k, all_stats = FALSE)

Arguments

object A ConsensusPartitionList-class object.

k Number of subgroups. The value can only be a single value.

all_stats Whether to show all statistics that were calculated. Used internally.

Value

A matrix of partition statistics for a selected k. Rows in the matrix correspond to combinations of top-value methods and partitioning methods.
Author(s)
Zuguang Gu <z.gu@dkfz.de>

Examples

```r
data(golub_cola)
get_stats(golub_cola, k = 2)
```

---

golub_cola  

Example ConsensusPartitionList object from Golub dataset

Description

Example ConsensusPartitionList object from Golub dataset

Usage

```r
data(golub_cola)
```
Details

Following code was used to generate `golub_cola`:

```r
library(cola)

library(golubEsets)  # from bioc
data(Golub_Merge)
m = exprs(Golub_Merge)
colnames(m) = paste0("sample_", colnames(m))
anno = pData(Golub_Merge)

m[m <= 1] = NA
m = log10(m)

m = adjust_matrix(m)

library(preprocessCore)  # from bioc
cn = colnames(m)
rn = rownames(m)
m = normalize.quantiles(m)
colnames(m) = cn
rownames(m) = rn

set.seed(123)
golub_cola = run_all_consensus_partition_methods(
m, cores = 6,
    anno = anno[, c("ALL.AML"), drop = FALSE],
    anno_col = c("ALL" = "red", "AML" = "blue")
)
```

```

HierarchicalPartition-class

The HierarchicalPartition class

Description

The HierarchicalPartition class

Methods

The `HierarchicalPartition-class` has following methods:

- `hierarchical_partition`: constructor method.
- `collect_classes`, `HierarchicalPartition-method`: plot the hierarchy of subgroups predicted.
- `get_classes`, `HierarchicalPartition-method`: get the class IDs of subgroups.
- `suggest_best_k`, `HierarchicalPartition-method`: guess the best number of partitions for each node.
- `get_matrix`, `HierarchicalPartition-method`: get the original matrix.
- `get_signatures`, `HierarchicalPartition-method`: get the signatures for each subgroup.
- `compare_signatures`, `HierarchicalPartition-method`: compare signatures from different nodes.
- `test_to_known_factors`, `HierarchicalPartition-method`: test correlation between predicted subgrouping and known annotations, if available.
hierarchical_partition

Hierarchical partition

Description
Hierarchical partition

Usage
hierarchical_partition(data,  
top_n = NULL,  
top_value_method = "ATC",  
partition_method = "skmeans",  
combination_method = expand.grid(top_value_method, partition_method),  
anno = NULL, anno_col = NULL,  
mean_silhouette_cutoff = 0.9, min_samples = max(6, round(ncol(data)*0.01)),  
subset = 1Inf, predict_method = "centroid",  
group_diff = ifelse(scale_rows, 0.5, 0),  
fdr_cutoff = cola_opt$fdr_cutoff,  
min_n_signatures = NULL,  
filter_fun = function(mat) {  
s = rowSds(mat)  
s > quantile(unique(s[s > 1e-10]), 0.05, na.rm = TRUE)  
},  
max_k = 4, scale_rows = TRUE, verbose = TRUE, mc.cores = 1, cores = mc.cores, help = TRUE, ...)

Arguments
  data                  a numeric matrix where subgroups are found by columns.  
top_n                 Number of rows with top values.  
top_value_method      a single or a vector of top-value methods. Available methods are in all_top_value_methods.  
partition_method      a single or a vector of partition methods. Available methods are in all_partition_methods.
combination_method
A list of combinations of top-value methods and partitioning methods. The value can be a two-column data frame where the first column is the top-value methods and the second column is the partitioning methods. Or it can be a vector of combination names in a form of "top_value_method:partitioning_method".

anno
A data frame with known annotation of samples. The annotations will be plotted in heatmaps and the correlation to predicted subgroups will be tested.

anno_col
A list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.

mean_silhouette_cutoff
The cutoff to test whether partition in current node is stable.

min_samples
the cutoff of number of samples to determine whether to continue looking for subgroups.

group_diff
Pass to get_signatures,ConsensusPartition-method.

fdr_cutoff
Pass to get_signatures,ConsensusPartition-method.

subset
Number of columns to randomly sample.

predict_method
Method for predicting class labels. Possible values are "centroid", "svm" and "randomForest".

min_n_signatures
Minimal number of signatures under the best classification.

filter_fun
A self-defined function which filters the original matrix and returns a submatrix for partitioning.

max_k
maximal number of partitions to try. The function will try 2:max_k partitions. Note this is the number of partitions that will be tried out on each node of the hierarchical partition. Since more subgroups will be found in the whole partition hierarchy, on each node, max_k should not be set to a large value.

scale_rows
Whether rows are scaled?

verbose
whether print message.

mc.cores
multiple cores to use. This argument will be removed in future versions.

cores
Number of cores, or a cluster object returned by makeCluster.

help
Whether to show the help message.

... pass to consensus_partition

Details
The function looks for subgroups in a hierarchical way.

There is a special way to encode the node in the hierarchy. The length of the node name is the depth of the node in the hierarchy and the substring excluding the last digit is the name node of the parent node. E.g. for the node 0011, the depth is 4 and the parent node is 001.

Value
A HierarchicalPartition-class object. Simply type object in the interactive R session to see which functions can be applied on it.
is_best_k-ConsensusPartition-method

Test whether the current k is the best/optional k

Description
Test whether the current k is the best/optional k

Usage

## S4 method for signature 'ConsensusPartition'
is_best_k(object, k, ...)

Arguments

object A ConsensusPartition-class object.
k Number of subgroups.
... Pass to suggest_best_k,ConsensusPartition-method.

Details
Optional best k is also assigned as TRUE.

Value
Logical scalar.
Examples

```r
data(golub_cola)
obj = golub_cola["ATC", "skmeans"]
is_best_k(obj, k = 2)
is_best_k(obj, k = 3)
```

Description

Test whether the current k is the best/optional k

Usage

```r
## S4 method for signature 'ConsensusPartitionList'
is_best_k(object, k, ...)
```

Arguments

- `object`: A `ConsensusPartitionList-class` object.
- `k`: Number of subgroups.
- `...`: Pass to `suggest_best_k,ConsensusPartitionList-method`.

Details

It tests on the partitions for every method.

Value

Logical vector.

Examples

```r
data(golub_cola)
is_best_k(golub_cola, k = 3)
```
is_best_k—dispatch

Method dispatch page for is_best_k.

Description

Method dispatch page for is_best_k.

Dispatch

is_best_k can be dispatched on following classes:

- `is_best_k,ConsensusPartition-method, ConsensusPartition-class` class method
- `is_best_k,ConsensusPartitionList-method, ConsensusPartitionList-class` class method

Examples

```r
# no example
NULL
```

is_leaf_node—HierarchicalPartition-method

Test whether a node is a leaf node

Description

Test whether a node is a leaf node

Usage

```r
## S4 method for signature 'HierarchicalPartition'
is_leaf_node(object, node, merge_node = merge_node_param())
```

Arguments

- `object` A `HierarchicalPartition-class` object.
- `node` A vector of node IDs.
- `merge_node` Parameters to merge sub-dendrograms, see `merge_node_param`.

Examples

```r
data(golub_cola_rh)
is_leaf_node(golub_cola_rh, all_leaves(golub_cola_rh))
```
is_stable_k-ConsensusPartition-method

Test whether the current k corresponds to a stable partition

Description

Test whether the current k corresponds to a stable partition

Usage

```r
## S4 method for signature 'ConsensusPartition'
is_stable_k(object, k, stable_PAC = 0.1, ...)
```

Arguments

- `k`: Number of subgroups.
- `stable_PAC`: Cutoff for stable PAC.
- `...`: Pass to `suggest_best_k,ConsensusPartition-method`.

Details

If 1-PAC for the k is larger than 0.9 (10% ambiguity for the partition), cola marks it as a stable partition.

Value

Logical scalar.

Examples

```r
data(golub_cola)
obj = golub_cola["ATC", "skmeans"]
is_stable_k(obj, k = 2)
is_stable_k(obj, k = 3)
```
is_stable_k-dispatch

is_stable_k-ConsensusPartitionList-method

Test whether the current k corresponds to a stable partition

Description

Test whether the current k corresponds to a stable partition

Usage

## S4 method for signature 'ConsensusPartitionList'

is_stable_k(object, k, ...)

Arguments

- **object**: A ConsensusPartitionList-class object.
- **k**: Number of subgroups.
- **...**: Pass to suggest_best_k,ConsensusPartitionList-method.

Details

It tests on the partitions for every method.

Value

Logical vector

Examples

data(golub_cola)

is_stable_k(golub_cola, k = 3)

is_stable_k-dispatch  Method dispatch page for is_stable_k

Description

Method dispatch page for is_stable_k.

Dispatch

is_stable_k can be dispatched on following classes:

- is_stable_k,ConsensusPartitionList-method, ConsensusPartitionList-class class method
- is_stable_k,ConsensusPartition-method, ConsensusPartition-class class method
### knee_finder2

Find the knee/elbow of a list of sorted points

#### Description

Find the knee/elbow of a list of sorted points

#### Usage

```r
knee_finder2(x, plot = FALSE)
```

#### Arguments

- `x`: A numeric vector.
- `plot`: Whether to make the plot.

#### Value

A vector of two numeric values. One for the left knee and the second for the right knee.

#### Examples

```r
x = rnorm(1000)
knee_finder2(x, plot = TRUE)
```

---

### knitr_add_tab_item

Add JavaScript tab in the report

#### Description

Add JavaScript tab in the report

#### Usage

```r
knitr_add_tab_item(code, header, prefix, desc = "", opt = NULL, message = NULL, hide_and_show = FALSE)
```
Arguments

- code: R code to execute.
- header: Header or the title for the tab.
- prefix: Prefix of the chunk label.
- desc: Description in the tab.
- opt: Options for the knitr chunk.
- message: Message to print.
- hide_and_show: Whether to hide the code output.

Details

Each tab contains the R source code and results generated from it (figure, tables, text, ...).
This function is only for internal use.

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

See Also

knitr_insert_tabs produces a complete HTML fragment.

Examples

# There is no example
NULL

knitr_insert_tabs Generate the HTML fragment for the JavaScript tabs

Description

Generate the HTML fragment for the JavaScript tabs

Usage

knitr_insert_tabs(uid)

Arguments

- uid: A unique identifier for the div.
The jQuery UI is used to generate html tabs ([https://jqueryui.com/tabs/](https://jqueryui.com/tabs/)).

`knitr_insert_tabs` should be used after several calls of `knitr_add_tab_item` to generate a complete HTML fragment for all tabs with all necessary Javascript and css code. This function is only for internal use.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```
# There is no example
NULL
```

---

**map_to_entrez_id**  
*Map to Entrez IDs*

**Description**

Map to Entrez IDs

**Usage**

```
map_to_entrez_id(from, org_db = "org.Hs.eg.db")
```

**Arguments**

- `from`  
The input gene ID type. Valid values should be in, e.g. `columns(org.Hs.eg.db::org.Hs.eg.db)`.

- `org_db`  
The annotation database.

**Details**

If there are multiple mappings from the input ID type to an unique Entrez ID, it randomly picks one.

**Value**

A named vectors where names are IDs with input ID type and values are the Entrez IDs. The returned object normally is used in `functional_enrichment`.
max_depth-HierarchicalPartition-method

Max depth of the hierarchy

Description

Max depth of the hierarchy

Usage

```r
## S4 method for signature 'HierarchicalPartition'
max_depth(object)
```

Arguments

- `object` A `HierarchicalPartition-class` object.

Value

A numeric value.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

```r
data(golub_cola_rh)
max_depth(golub_cola_rh)
```
Membership heatmap for Consensus Partition method

Heatmap of membership in each partition

Description
Heatmap of membership in each partition

Usage
```r
## S4 method for signature 'ConsensusPartition'
membership_heatmap(object, k, internal = FALSE,
                  anno = object@anno, anno_col = get_anno_col(object),
                  show_column_names = FALSE, column_names_gp = gpar(fontsize = 8), ...)
```

Arguments

- `k`: Number of subgroups.
- `internal`: Used internally.
- `anno`: A data frame of annotations for the original matrix columns. By default it uses the annotations specified in `consensus_partition` or `run_all_consensus_partition_methods`.
- `anno_col`: A list of colors (color is defined as a named vector) for the annotations. If `anno` is a data frame, `anno_col` should be a named list where names correspond to the column names in `anno`.
- `show_column_names`: Whether show column names in the heatmap (which is the column name in the original matrix).
- `column_names_gp`: Graphics parameters for column names.
- `...`: Other arguments.

Details
Each row in the heatmap is the membership in one single partition.
Heatmap is split on rows by `top_n`.

Value
No value is returned.

Author(s)
Zuguang Gu <z.gu@dkfz.de>
Examples

```r
data(golub_cola)
membership_heatmap(golub_cola[c("ATC", "skmeans"), k = 3])
```

merge_node-HierarchicalPartition-method

Merge node

Description

Merge node

Usage

```r
## S4 method for signature 'HierarchicalPartition'
merge_node(object, node_id)
```

Arguments

- `node_id`: A vector of node IDs where each node is merged as a leaf node.

Value

A `HierarchicalPartition-class` object.

Examples

```r
# There is no example
NULL
```

merge_node_param

Parameters to merge branches in subgroup dendrogram.

Description

Parameters to merge branches in subgroup dendrogram.

Usage

```r
merge_node_param(depth = Inf, min_n_signatures = -Inf, 
                 min_p_signatures = -Inf)
```
Arguments

depth  Depth of the dendrogram.

min_n_signatures  Minimal number of signatures for the partitioning on each node.

min_p_signatures  Minimal fraction of signatures compared to the total number of rows on each node.

Examples

# There is no example
NULL

Description

Number of columns in the matrix

Usage

## S4 method for signature 'ConsensusPartition'
ncol(x)

Arguments

x  A ConsensusPartition-class object.

Examples

# There is no example
NULL
Description

Number of columns in the matrix

Usage

## S4 method for signature 'ConsensusPartitionList'
ncol(x)

Arguments

x
A ConsensusPartitionList-class object.

Examples

# There is no example
NULL

ncol-dispatch

Method dispatch page for ncol

Description

Method dispatch page for ncol.

Dispatch

ncol can be dispatched on following classes:

- ncol,ConsensusPartitionList-method, ConsensusPartitionList-class class method
- ncol,ConsensusPartition-method, ConsensusPartition-class class method
- ncol,DownSamplingConsensusPartition-method, DownSamplingConsensusPartition-class class method
- ncol,HierarchicalPartition-method, HierarchicalPartition-class class method

Examples

# no example
NULL
Description
Number of columns in the matrix

Usage

```r
## S4 method for signature 'DownSamplingConsensusPartition'
ncol(x)
```

Arguments

- `x`: A `DownSamplingConsensusPartition-class` object.

Examples

```r
# There is no example
NULL
```

Description
Number of columns in the matrix

Usage

```r
## S4 method for signature 'HierarchicalPartition'
ncol(x)
```

Arguments

- `x`: A `HierarchicalPartition-class` object.

Examples

```r
# There is no example
NULL
```
node_info-HierarchicalPartition-method

Information on the nodes

Description

Information on the nodes

Usage

## S4 method for signature 'HierarchicalPartition'
node_info(object)

Arguments

object A HierarchicalPartition-class object.

Details

It returns the following node-level information:

- id Node id.
- n_columns Number of columns.
- n_signatures Number of signatures.
- p_signatures Percent of signatures.
- is_leaf Whether the node is a leaf

Examples

# There is no example
NULL

node_level-HierarchicalPartition-method

Information on the nodes

Description

Information on the nodes

Usage

## S4 method for signature 'HierarchicalPartition'
node_level(object)
nrow-ConsensusPartition-method

Arguments

object A HierarchicalPartition-class object.

Details

It is the same as node_info,HierarchicalPartition-method.

Examples

# There is no example
NULL

Description

Number of rows in the matrix

Usage

## S4 method for signature 'ConsensusPartition'
nrow(x)

Arguments

x A ConsensusPartition-class object.

Examples

# There is no example
NULL
nrow-ConsensusPartitionList-method

Number of rows in the matrix

Description
Number of rows in the matrix

Usage
## S4 method for signature 'ConsensusPartitionList'
nrow(x)

Arguments
x A ConsensusPartitionList-class object.

Examples
# There is no example
NULL

nrow-dispatch

Method dispatch page for nrow

Description
Method dispatch page for nrow.

Dispatch
nrow can be dispatched on following classes:

- nrow,HierarchicalPartition-method, HierarchicalPartition-class class method
- nrow,ConsensusPartitionList-method, ConsensusPartitionList-class class method
- nrow,ConsensusPartition-method, ConsensusPartition-class class method

Examples
# no example
NULL
nrow-HierarchicalPartition-method

Number of rows in the matrix

Description
Number of rows in the matrix

Usage
## S4 method for signature 'HierarchicalPartition'
nrow(x)

Arguments
x A HierarchicalPartition-class object.

Examples
# There is no example
NULL

PAC

The proportion of ambiguous clustering (PAC score)

Description
The proportion of ambiguous clustering (PAC score)

Usage
PAC(consensus_mat, x1 = 0.1, x2 = 0.9, class = NULL)

Arguments
consensus_mat A consensus matrix.
x1 Lower bound to define "ambiguous clustering".
x2 Upper bound to define "ambiguous clustering".
class Subgroup labels. If it is provided, samples with silhouette score less than the 5\textsuperscript{th} percential are removed from PAC calculation.

Details
The PAC score is defined as F(x2) - F(x1) where F(x) is the CDF of the consensus matrix.
Value

A single numeric value.

See

See https://www.nature.com/articles/srep06207 for explanation of PAC score.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

data(golub_cola)
PAC(get_consensus(golub_cola[1, 1], k = 2))
PAC(get_consensus(golub_cola[1, 1], k = 3))
PAC(get_consensus(golub_cola[1, 1], k = 4))
PAC(get_consensus(golub_cola[1, 1], k = 5))
PAC(get_consensus(golub_cola[1, 1], k = 6))

# with specifying `class`
PAC(get_consensus(golub_cola[1, 1], k = 2),
   class = get_classes(golub_cola[1, 1], k = 2)[, 1])

plot_ecdf-ConsensusPartition-method

Plot the empirical cumulative distribution (eCDF) curve of the consensus matrix.

Description

Plot the empirical cumulative distribution (eCDF) curve of the consensus matrix.

Usage

## S4 method for signature 'ConsensusPartition'
plot_ecdf(object, ...)

Arguments

object A ConsensusPartition-class object.
...
Other arguments.

Details

It plots eCDF curve for each k.

This function is mainly used in collect_plots and select_partition_number functions.
**predict_classes-ConsensusPartition-method**

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**See Also**

See `ecdf` for a detailed explanation of the empirical cumulative distribution function.

**Examples**

```r
data(golub_cola)
plot_ecdf(golub_cola["ATC", "skmeans"])
```

---

**Description**

Predict classes for new samples based on cola classification

**Usage**

```r
## S4 method for signature 'ConsensusPartition'
predict_classes(object, k, mat,
    silhouette_cutoff = 0.5,
    fdr_cutoff = cola_opt$fdr_cutoff,
    group_diff = cola_opt$group_diff,
    scale_rows = object@scale_rows,
    diff_method = "Ftest",
    method = "centroid",
    dist_method = c("euclidean", "correlation", "cosine"), nperm = 1000,
    p_cutoff = 0.05, plot = TRUE, col_fun = NULL,
    split_by_signatures = FALSE, force = FALSE,
    verbose = TRUE, help = TRUE, prefix = "",
    mc.cores = 1, cores = mc.cores)
```

**Arguments**

- `object` A `ConsensusPartition-class` object.
- `k` Number of subgroups to get the classifications.
- `mat` The new matrix where the sample classes are going to be predicted. The number of rows should be the same as the original matrix for cola analysis (also make sure the row orders are the same). Be careful that the scaling of `mat` should be the same as that applied in cola analysis.
silhouette_cutoff
Send to `get_signatures,ConsensusPartition-method` for determining signatures.

fdr_cutoff
Send to `get_signatures,ConsensusPartition-method` for determining signatures.

group_diff
Send to `get_signatures,ConsensusPartition-method` for determining signatures.

scale_rows
Send to `get_signatures,ConsensusPartition-method` for determining signatures.

diff_method
Send to `get_signatures,ConsensusPartition-method` for determining signatures.

method
Method for predicting class labels. Possible values are "centroid", "svm" and "randomForest".

dist_method
Distance method. Value should be "euclidean", "correlation" or "cosine". Send to `predict_classes,matrix-method`.

nperm
Number of permutations. It is used when `dist_method` is set to "euclidean" or "cosine". Send to `predict_classes,matrix-method`.

p_cutoff
Cutoff for the p-values for determining class assignment. Send to `predict_classes,matrix-method`.

plot
Whether to draw the plot that visualizes the process of prediction. Send to `predict_classes,matrix-method`.

col_fun
A color mapping function generated from `colorRamp2`. It is set to both heatmaps.

split_by_signatures
Should the heatmaps be split based on k-means on the main heatmap, or on the patterns of the signature heatmap.

force
If the value is `TRUE` and when `get_signatures,ConsensusPartition-method` internally failed, top 1000 rows with the highest between-group mean difference are used for constructing the signature centroid matrix. It is basically used internally.

verbose
Whether to print messages. Send to `predict_classes,matrix-method`.

help
Whether to print help messages.

prefix
Used internally.

mc.cores
Number of cores. This argument will be removed in future versions.

cores
Number of cores, or a cluster object returned by `makeCluster`.

Details
The prediction is based on the signature centroid matrix from cola classification. The processes are as follows:

1. For the provided `ConsensusPartition-class` object and a selected k, the signatures that discriminate classes are extracted by `get_signatures,ConsensusPartition-method`. If number of signatures is more than 2000, only 2000 signatures are randomly sampled. 2. The signature centroid matrix is a k-column matrix where each column is the centroid of samples in the corresponding class, i.e. the mean across samples. If rows were scaled in cola analysis, the signature centroid matrix is the mean of scaled values and vise versa. Please note the samples with silhouette score less
than silhouette_cutoff are removed for calculating the centroids. 3. With the signature centroid matrix and the new matrix, it calls predict_classes,matrix-method to perform the prediction. Please see more details of the prediction on that help page. Please note, the scales of the new matrix should be the same as the matrix used for cola analysis.

Value

A data frame with two columns: the class labels (in numeric) and the corresponding p-values.

See Also

predict_classes,matrix-method that predicts the classes for new samples.

Examples

data(golub_cola)
res = golub_cola["ATC:skmeans"]
mat = get_matrix(res)
# note scaling should be applied here because the matrix was scaled in the cola analysis
mat2 = t(scale(t(mat)))
cl = predict_classes(res, k = 3, mat2)
# compare the real classification and the predicted classification
data.frame(cola_class = get_classes(res, k = 3)[, "class"],
          predicted = cl[, "class"])
# change to correlation method
cl = predict_classes(res, k = 3, mat2, dist_method = "correlation")
# compare the real classification and the predicted classification
data.frame(cola_class = get_classes(res, k = 3)[, "class"],
          predicted = cl[, "class"])

Method dispatch page for predict_classes

Description

Method dispatch page for predict_classes.

Dispatch

predict_classes can be dispatched on following classes:

- predict_classes,matrix-method, matrix-class class method
- predict_classes,ConsensusPartition-method, ConsensusPartition-class class method
Examples

```r
# no example
NULL
```

**predict_classes-matrix-method**

Predict classes for new samples based on signature centroid matrix

**Description**

Predict classes for new samples based on signature centroid matrix

**Usage**

```r
## S4 method for signature 'matrix'
predict_classes(object, mat, dist_method = c("euclidean", "correlation", "cosine"),
               nperm = 1000, p_cutoff = 0.05, plot = TRUE, col_fun = NULL, split_by_signatures = FALSE,
               verbose = TRUE, prefix = ", mc.cores = 1, cores = mc.cores, width1 = NULL, width2 = NULL)
```

**Arguments**

- `object`: The signature centroid matrix. See the Details section.
- `mat`: The new matrix where the classes are going to be predicted. The number of rows should be the same as the signature centroid matrix (also make sure the row orders are the same). Be careful that `mat` should be in the same scale as the centroid matrix.
- `dist_method`: Distance method. Value should be "euclidean", "correlation" or "cosine".
- `nperm`: Number of permutations. It is used when `dist_method` is set to "euclidean" or "cosine".
- `p_cutoff`: Cutoff for the p-values for determining class assignment.
- `plot`: Whether to draw the plot that visualizes the process of prediction.
- `col_fun`: A color mapping function generated from `colorRamp2`. It is set to both heatmaps.
- `verbose`: Whether to print messages.
- `split_by_signatures`: Should the heatmaps be split based on k-means on the main heatmap, or on the patterns of the signature heatmap.
- `prefix`: Used internally.
- `mc.cores`: Number of cores. This argument will be removed in future versions.
- `cores`: Number of cores, or a `cluster` object returned by `makeCluster`.
- `width1`: Width of the first heatmap.
- `width2`: Width of the second heatmap.
Details

The signature centroid matrix is a k-column matrix where each column is the centroid of samples in the corresponding class (k-group classification).

For each sample in the new matrix, the task is basically to test which signature centroid the current sample is the closest to. There are two methods: the Euclidean distance and the correlation (Spearman) distance.

For the Euclidean/cosine distance method, for the vector denoted as x which corresponds to sample i in the new matrix, to test which class should be assigned to sample i, the distance between sample i and all k signature centroids are calculated and denoted as d_1, d_2, ..., d_k. The class with the smallest distance is assigned to sample i. The distances for k centroids are sorted increasingly, and we design a statistic named "difference ratio", denoted as r and calculated as: (d_1 - d_2)/mean(d), which is the difference between the smallest distance and the second smallest distance, normalized by the mean distance. To test the statistical significance of r, we randomly permute rows of the signature centroid matrix and calculate r_rand. The random permutation is performed n_perm times and the p-value is calculated as the proportion of r_rand being larger than r.

For the correlation method, the distance is calculated as the Spearman correlation between sample i and signature centroid k. The label for the class with the maximal correlation value is assigned to sample i. The p-value is simply calculated by cor.test between sample i and centroid k.

If a sample is tested with a p-value higher than p_cutoff, the corresponding class label is set to NA.

Value

A data frame with two columns: the class labels (the column names of the signature centroid matrix are treated as class labels) and the corresponding p-values.

Examples

data(golub_cola)
res = golub_cola["ATC:skmeans"]
mat = get_matrix(res)
# note scaling should be applied here because the matrix was scaled in the cola analysis
mat2 = t(scale(t(mat)))

# this is how the signature centroid matrix looks like:
head(sig_mat)

mat2 = mat2[which_row, , drop = FALSE]
# now we predict the class for `mat2` based on `sig_mat`
predict_classes(sig_mat, mat2)
print.hc_table_suggest_best_k

Print the hc_table_suggest_best_k object

Description
Print the hc_table_suggest_best_k object

Usage
## S3 method for class 'hc_table_suggest_best_k'
print(x, ...)

Arguments

x
A hc_table_suggest_best_k object from suggest_best_k,HierarchicalPartition-method.

...
Other arguments.

Examples

# There is no example
NULL

recalc_stats

Recalculate statistics in the ConsensusPartitionList object

Description
Recalculate statistics in the ConsensusPartitionList object

Usage
recalc_stats(rl)

Arguments

rl
A ConsensusPartitionList-class object.

Details
It updates the stat slot in the ConsensusPartitionList object, used internally.

Examples

# There is no example
NULL
register_NMF

Register NMF partitioning method

Description

Register NMF partitioning method

Usage

register_NMF()

Details

NMF analysis is performed by \texttt{nmf}.

Examples

# There is no example
NULL

register_partition_methods

Register user-defined partitioning methods

Description

Register user-defined partitioning methods

Usage

register_partition_methods(..., scale_method = c("z-score", "min-max", "none"))

Arguments

... A named list of functions.

scale_method Normally, data matrix is scaled by rows before sent to the partition function. The default scaling is applied by \texttt{scale}. However, some partition functions may not accept negative values which are produced by \texttt{scale}. Here \texttt{scale_method} can be set to \texttt{min-max} which scales rows by \((x - \min)/(\max - \min)\). Note here \texttt{scale_method} only means the method to scale rows. When \texttt{scale_rows} is set to \texttt{FALSE} in \texttt{consensus_partition} or \texttt{run_all_consensus_partition_methods}, there will be no row scaling when doing partitioning. The value for \texttt{scale_method} can be a vector if user specifies more than one partition function.
Details

The user-defined function should accept at least two arguments. The first two arguments are the data matrix and the number of subgroups. The third optional argument should always be ... so that parameters for the partition function can be passed by partition_param from consensus_partition. If users forget to add ... , it is added internally.

The function should return a vector of partitions (or class labels) or an object which can be recognized by cl_membership.

The partition function should be applied on columns (Users should be careful with this because some R functions apply on rows and some R functions apply on columns). E.g. following is how we register kmeans partition method:

```r
register_partition_methods(
  kmeans = function(mat, k, ...) {
    # mat is transposed because kmeans() applies on rows
    kmeans(t(mat), centers = k, ...)$centers
  }
)
```

The registered partitioning methods will be used as defaults in run_all_consensus_partition_methods. To remove a partitioning method, use remove_partition_methods.

There are following default partitioning methods:

"hclust" hierarchcial clustering with Euclidean distance, later columns are partitioned by cutree. If users want to use another distance metric or clustering method, consider to register a new partitioning method. E.g. register_partition_methods(hclust_cor = function(mat, k) cutree(hclust(as.dist(cor(mat))))).

"kmeans" by kmeans.

"skmeans" by skmeans.

"pam" by pam.

"mclust" by Mclust. mclust is applied to the first three principle components from rows.

Users can register two other pre-defined partitioning methods by register_NMF and register_SOM.

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

See Also

all_partition_methods lists all registered partitioning methods.
Examples

```r
all_partition_methods()
register_partition_methods(
    random = function(mat, k) sample(k, ncol(mat), replace = TRUE)
)
all_partition_methods()
remove_partition_methods("random")
```

Description

Register SOM partitioning method

Usage

```r
register_SOM()
```

Details

The SOM analysis is performed by `som`.

Examples

```r
# There is no example
NULL
```

Register user-defined top-value methods

Description

Register user-defined top-value methods

Usage

```r
register_top_value_methods(..., validate = TRUE)
```

Arguments

- `...` A named list of functions.
- `validate` Whether validate the functions.
register_top_value_methods

Details
The user-defined function should accept one argument which is the data matrix where the scores are calculated by rows. Rows with top scores are treated as "top rows" in cola analysis. Following is how we register "SD" (standard deviation) top-value method:

    register_top_value_methods(SD = function(mat) apply(mat, 1, sd))

Of course, you can use rowSds to give a faster calculation of row SD:

    register_top_value_methods(SD = rowSds)

The registered top-value method will be used as defaults in run_all_consensus_partition_methods.
To remove a top-value method, use remove_top_value_methods.
There are four default top-value methods:

"SD" standard deviation, by rowSds.
"CV" coefficient variance, calculated as sd/(mean+s) where s is the 10^th percentile of all row means.
"MAD" median absolute deviation, by rowMads.
"ATC" the ATC method.

Value
No value is returned.

all_top_value_methods lists all registered top-value methods.

Examples

    all_top_value_methods()
    register_top_value_methods(
        ATC_spearman = function(mat) ATC(mat, method = "spearman")
    )
    all_top_value_methods()
    remove_top_value_methods("ATC_spearman")
**relabel_class**

*Relabel class labels according to the reference labels*

**Description**

Relabel class labels according to the reference labels

**Usage**

```r
relabel_class(class, ref, full_set = union(class, ref), return_map = TRUE)
```

**Arguments**

- `class`: A vector of class labels.
- `ref`: A vector of reference labels.
- `full_set`: The full set of labels.
- `return_map`: Whether to return the mapping of the adjusted labels.

**Details**

In partitions, the exact value of the class label is not of importance. E.g. for two partitions `a, a, a, b, b, b, b` and `b, b, b, a, a, a`, they are the same partitions although the labels of `a` and `b` are switched in the two partitions. Even the partition `c, c, d, d, d, d` is the same as the previous two although it uses a different set of labels. Here `relabel_class` function relabels class vector according to the labels in `ref` vector by looking for a mapping `m()` to maximize `sum(m(class) == ref)`.

Mathematically, this is called linear sum assignment problem and it is solved by `solve_LSAP`.

**Value**

A named vector where names correspond to the labels in `class` and values correspond to `ref`, which means `map = relabel_class(class, ref); map[class]` returns the relabelled labels.

The returned object attaches a data frame with three columns:

- original labels. in `class`
- adjusted labels. according to `ref`
- reference labels. in `ref`

If `return_map` in the `relabel_class` is set to `FALSE`, the function simply returns a vector of adjusted class labels.

If the function returns the mapping vector (when `return_map = TRUE`), the mapping variable is always character, which means, if your `class` and `ref` are numeric, you need to convert them back to numeric explicitly. If `return_map = FALSE`, the returned relabelled vector has the same mode as `class`.
Examples

```r
class = c(rep("a", 10), rep("b", 3))
ref = c(rep("b", 4), rep("a", 9))
relabel_class(class, ref)
relabel_class(class, ref, return_map = FALSE)
# if class and ref are from completely different sets
class = c(rep("A", 10), rep("B", 3))
relabel_class(class, ref)

# class labels are numeric
class = c(rep(1, 10), rep(2, 3))
ref = c(rep(2, 4), rep(1, 9))
relabel_class(class, ref)
relabel_class(class, ref, return_map = FALSE)
```

---

**remove_partition_methods**

*Remove partitioning methods*

**Description**

Remove partitioning methods

**Usage**

```r
remove_partition_methods(method)
```

**Arguments**

- **method**
  
  Name of the partitioning methods to be removed.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```r
# There is no example
NULL
```
remove_top_value_methods

 Remove top-value methods

Description
Remove top-value methods

Usage
remove_top_value_methods(method)

Arguments
method
Name of the top-value methods to be removed.

Value
No value is returned.

Author(s)
Zuguang Gu <z.gu@dkfz.de>

Examples
# There is no example
NULL

rownames-ConsensusPartition-method

 Row names of the matrix

Description
Row names of the matrix

Usage
## S4 method for signature 'ConsensusPartition'
rownames(x)

Arguments
x A ConsensusPartition-class object.
Examples

# There is no example
NULL

# S4 method for signature 'ConsensusPartitionList'
rownames(x)

Arguments

x A ConsensusPartitionList-class object.

Examples

# There is no example
NULL

# no example
NULL

Description

Method dispatch page for rownames.

Dispatch

rownames can be dispatched on following classes:

- rownames,HierarchicalPartition-method, HierarchicalPartition-class class method
- rownames,ConsensusPartition-method, ConsensusPartition-class class method
- rownames,ConsensusPartitionList-method, ConsensusPartitionList-class class method

Examples

# no example
NULL
**rownames-HierarchicalPartition-method**

*Row names of the matrix*

---

**Description**

Row names of the matrix

**Usage**

```r
## S4 method for signature 'HierarchicalPartition'
rownames(x)
```

**Arguments**

- `x` A `HierarchicalPartition-class` object.

**Examples**

```r
# There is no example
NULL
```

---

**run_all_consensus_partition_methods**

*Consensus partitioning for all combinations of methods*

---

**Description**

Consensus partitioning for all combinations of methods

**Usage**

```r
run_all_consensus_partition_methods(data,
   top_value_method = all_top_value_methods(),
   partition_method = all_partition_methods(),
   max_k = 6, k = NULL,
   top_n = NULL,
   mc.cores = 1, cores = mc.cores, anno = NULL, anno_col = NULL,
   sample_by = "row", p_sampling = 0.8, partition_repeat = 50,
   scale_rows = NULL, verbose = TRUE, help = cola_opt$help)
```
run_all_consensus_partition_methods

Arguments

data
A numeric matrix where subgroups are found by columns.

top_value_method
Method which are used to extract top n rows. Allowed methods are in all_top_value_methods and can be self-added by register_top_value_methods.

partition_method
Method which are used to partition samples. Allowed methods are in all_partition_methods and can be self-added by register_partition_methods.

max_k
Maximal number of subgroups to try. The function will try 2:max_k subgroups.

k
Alternatively, you can specify a vector k.

top_n
Number of rows with top values. The value can be a vector with length > 1. When n > 5000, the function only randomly sample 5000 rows from top n rows. If top_n is a vector, partition will be applied to every values in top_n and consensus partition is summarized from all partitions.

mc.cores
Number of cores to use. This argument will be removed in future versions.

cores
Number of cores, or a cluster object returned by makeCluster.

anno
A data frame with known annotation of columns.

anno_col
A list of colors (color is defined as a named vector) for the annotations. If anno is a data frame, anno_col should be a named list where names correspond to the column names in anno.

sample_by
Should randomly sample the matrix by rows or by columns?

p_sampling
Proportion of the top n rows to sample.

partition_repeat
Number of repeats for the random sampling.

scale_rows
Whether to scale rows. If it is TRUE, scaling method defined in register_partition_methods is used.

verbose
Whether to print messages.

help
Whether to print help messages.

Details

The function performs consensus partitioning by consensus_partition for all combinations of top-value methods and partitioning methods.

It also adjusts the subgroup labels for all methods and for all k to make them as consistent as possible.

Value

A ConsensusPartitionList-class object. Simply type object in the interactive R session to see which functions can be applied on it.

Author(s)

Zuguang Gu <z.gu@dkfz.de>
Examples

```r
## Not run:
set.seed(123)
m = cbind(rbind(matrix(rnorm(20*20, mean = 1), nr = 20),
            matrix(rnorm(20*20, mean = -1), nr = 20)),
            rbind(matrix(rnorm(20*20, mean = -1), nr = 20),
            matrix(rnorm(20*20, mean = 1), nr = 20))
            ) + matrix(rnorm(40*40), nr = 40)
rl = run_all_consensus_partition_methods(data = m, top_n = c(20, 30, 40))
## End(Not run)
```

Description

Several plots for determining the optimized number of subgroups

Usage

```r
## S4 method for signature 'ConsensusPartition'
select_partition_number(object, mark_best = TRUE, all_stats = FALSE)
```

Arguments

- `object` A `ConsensusPartition-class` object.
- `mark_best` Whether mark the best k in the plot.
- `all_stats` Whether to show all statistics that were calculated. Used internally.

Details

There are following plots made:

- eCDF of the consensus matrix under each k, made by `plot_ecdf`, `ConsensusPartition-method`,
- PAC score,
- mean silhouette score,
- the `concordance` for each partition to the consensus partition,
- area increase of the area under the ECDF of consensus matrix with increasing k,
- Rand index for current k compared to k - 1,
- Jaccard coefficient for current k compared to k - 1,

Value

No value is returned.
Author(s)
Zuguang Gu <z.gu@dkfz.de>

Examples
```
data(golub_cola)
select_partition_number(golub_cola["ATC","skmeans"])
```

Description
Print the ConsensusPartition object

Usage
```
## S4 method for signature 'ConsensusPartition'
show(object)
```

Arguments
```
object    A ConsensusPartition-class object.
```

Value
No value is returned.

Author(s)
Zuguang Gu <z.gu@dkfz.de>

Examples
```
# There is no example
NULL
```
Description
Print the ConsensusPartitionList object

Usage
```r
## S4 method for signature 'ConsensusPartitionList'
show(object)
```

Arguments

object A `ConsensusPartitionList-class` object.

Value
No value is returned.

Author(s)
Zuguang Gu <z.gu@dkfz.de>

Examples
```r
# There is no example
NULL
```

Dispatch

Method dispatch page for `show`.

show can be dispatched on following classes:

- `show,HierarchicalPartition-method, HierarchicalPartition-class` class method
- `show,ConsensusPartition-method, ConsensusPartition-class` class method
- `show,ConsensusPartitionList-method, ConsensusPartitionList-class` class method
- `show,DownSamplingConsensusPartition-method, DownSamplingConsensusPartition-class` class method
Examples

```r
# no example
NULL
```

Description

Print the `DownSamplingConsensusPartition` object

Usage

```r
## S4 method for signature 'DownSamplingConsensusPartition'
show(object)
```

Arguments

- `object` A `DownSamplingConsensusPartition-class` object.

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

```r
data(golub_cola_ds)
golub_cola_ds
```
show-HierarchicalPartition-method

Print the HierarchicalPartition object

Description

Print the HierarchicalPartition object

Usage

## S4 method for signature 'HierarchicalPartition'
show(object)

Arguments

object a HierarchicalPartition-class object

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

data(golub_cola_rh)
golub_cola_rh

split_node-HierarchicalPartition-method

Split node

Description

Split node

Usage

## S4 method for signature 'HierarchicalPartition'
split_node(object, node_id, 
subset = object@param$subset,
min_samples = object@param$min_samples, max_k = object@param$max_k, cores = object@param$cores, 
verbose = TRUE, 
top_n = object@param$top_n, min_n_signatures = object@param$min_n_signatures, 
group_diff = object@param$group_diff, fdr_cutoff = object@param$fdr_cutoff)
suggest_best_k-ConsensusPartition-method

Arguments

- **object**: A `HierarchicalPartition-class` object.
- **node_id**: A single ID of a node that is going to be split.
- **subset**: The same as in `hierarchical_partition`.
- **min_samples**: The same as in `hierarchical_partition`.
- **max_k**: The same as in `hierarchical_partition`.
- **cores**: Number of cores.
- **verbose**: Whether to print messages.
- **top_n**: The same as in `hierarchical_partition`.
- **min_n_signatures**: The same as in `hierarchical_partition`.
- **group_diff**: The same as in `hierarchical_partition`.
- **fdr_cutoff**: The same as in `hierarchical_partition`.

Details

It applies hierarchical consensus partitioning on the specified node.

Value

A `HierarchicalPartition-class` object.

Examples

```r
# There is no example
NULL
```

Description

Suggest the best number of subgroups

Usage

```r
## S4 method for signature 'ConsensusPartition'
suggest_best_k(object,
    jaccard_index_cutoff = select_jaccard_cutoff(ncol(object)),
    mean_silhouette_cutoff = NULL,
    stable_PAC = 0.1, help = cola_opt$help)
```
suggest_best_k-ConsensusPartition-method

Arguments

object A ConsensusPartition-class object.
jaccard_index_cutoff The cutoff for Jaccard index for comparing to previous k.
mean_silhouette_cutoff Cutoff for mean silhouette scores.
stable_PAC Cutoff for stable PAC. This argument only take effect when mean_silhouette_cutoff is set to NULL.
help Whether to print help message.

Details

The best k is selected according to following rules:

- All k with Jaccard index larger than jaccard_index_cutoff are removed because increasing k does not provide enough extra information. If all k are removed, it is marked as no subgroup is detected.
- If all k with Jaccard index larger than 0.75, k with the highest mean silhouette score is taken as the best k.
- For all k with mean silhouette score larger than mean_silhouette_cutoff, the maximal k is taken as the best k, and other k are marked as optional best k.
- If argument mean_silhouette_cutoff is set to NULL, which means we do not filter by mean silhouette scores while by 1-PAC scores. Similarly, k with the highest 1-PAC is taken the best k and other k are marked as optional best k.
- If it does not fit the second rule. The k with the maximal vote of the highest 1-PAC score, highest mean silhouette, and highest concordance is taken as the best k.

It should be noted that it is difficult to find the best k deterministically, we encourage users to compare results for all k and determine a proper one which best explain their studies.

Value

The best k.

See

The selection of the best k can be visualized by select_partition_number.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

data(golub_cola)
obj = golub_cola["ATC", "skmeans"]
suggest_best_k(obj)
suggest_best_k-ConsensusPartitionList-method

Suggest the best number of subgroups

Description

Suggest the best number of subgroups

Usage

## S4 method for signature 'ConsensusPartitionList'
suggest_best_k(object, jaccard_index_cutoff = select_jaccard_cutoff(ncol(object)))

Arguments

object A ConsensusPartitionList-class object.
jaccard_index_cutoff The cutoff for Jaccard index for comparing to previous k.

Details

It basically gives the best k for each combination of top-value method and partitioning method by calling suggest_best_k,ConsensusPartition-method.

1-PAC score higher than 0.95 is treated as very stable partition (marked by **) and higher than 0.9 is treated as stable partition (marked by *).

Value

A data frame with the best k and other statistics for each combination of methods.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

data(golub_cola)
suggest_best_k(golub_cola)
Description

Method dispatch page for suggest_best_k.

Dispatch

suggest_best_k can be dispatched on following classes:

- `suggest_best_k,HierarchicalPartition-method,HierarchicalPartition-class` class method
- `suggest_best_k,ConsensusPartitionList-method,ConsensusPartitionList-class` class method
- `suggest_best_k,ConsensusPartition-method,ConsensusPartition-class` class method

Examples

```r
# no example
NULL
```

Description

Guess the best number of partitions

Usage

```r
## S4 method for signature 'HierarchicalPartition'
suggest_best_k(object)
```

Arguments

- `object` A `HierarchicalPartition-class` object.

Details

It basically gives the best k at each node.
**Value**

A data frame with the best k and other statistics for each node.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```r
data(golub_cola_rh)
suggest_best_k(golub_cola_rh)
```

---

**test_between_factors**  
*Test whether a list of factors are correlated*

**Description**

Test whether a list of factors are correlated

**Usage**

```r
test_between_factors(x, y = NULL, all_factors = FALSE, verbose = FALSE)
```

**Arguments**

- `x`  
  A data frame or a vector which contains discrete or continuous variables. if `y` is omit, pairwise testing for all columns in `x` is performed.
- `y`  
  A data frame or a vector which contains discrete or continuous variables.
- `all_factors`  
  Are all columns in `x` and `y` enforced to be factors?
- `verbose`  
  Whether to print messages.

**Details**

Pairwise test is applied to every two columns in the data frames. Methods are:

- two numeric variables: correlation test by `cor.test` is applied (Spearman method);
- two character or factor variables: `chisq.test` is applied;
- one numeric variable and one character/factor variable: oneway ANOVA test by `oneway.test` is applied.

This function can be used to test the correlation between the predicted classes and other known factors.

**Value**

A matrix of p-values. If there are NA values, basically it means there are no efficient data points to perform the test.
Author(s)
Zuguang Gu <z.gu@dkfz.de>

Examples

df = data.frame(
  v1 = rnorm(100),
  v2 = sample(letters[1:3], 100, replace = TRUE),
  v3 = sample(LETTERS[5:6], 100, replace = TRUE)
)
test_between_factors(df)
x = runif(100)
test_between_factors(x, df)

description
Test correspondence between predicted subgroups and known factors

Usage

## S4 method for signature 'ConsensusPartition'
test_to_known_factors(object, k, known = get_anno(object),
  silhouette_cutoff = 0.5, verbose = FALSE)

Arguments

- k: Number of subgroups. It uses all k if it is not specified.
- known: A vector or a data frame with known factors. By default it is the annotation table set in consensus_partition or run_all_consensus_partition_methods.
- silhouette_cutoff: Cutoff for silhouette scores. Samples with value less than it are omit.
- verbose: Whether to print messages.

Details
The test is performed by test_between_factors between the predicted classes and user’s annotation table.
Value
A data frame with the following columns:

- number of samples used to test after filtered by silhouette_cutoff,
- p-values from the tests,
- number of subgroups.

Author(s)
Zuguang Gu <z.gu@dkfz.de>

Examples
```r
data(golub_cola)
res = golub_cola["ATC:skmeans"]
anno = get_anno(res)
anno
test_to_known_factors(res, k = 3)
# or explicitly specify known argument
test_to_known_factors(res, k = 3, known = anno)
```

Description
Test correspondance between predicted classes and known factors

Usage
```r
## S4 method for signature 'ConsensusPartitionList'
test_to_known_factors(object, k, known = get_anno(object),
   silhouette_cutoff = 0.5, verbose = FALSE)
```

Arguments

- **object**: A `ConsensusPartitionList-class` object.
- **k**: Number of subgroups. It uses all k if it is not set.
- **known**: A vector or a data frame with known factors. By default it is the annotation table set in `consensus_partition` or `run_all_consensus_partition_methods`.
- **silhouette_cutoff**: Cutoff for silhouette scores. Samples with value less than this are omit.
- **verbose**: Whether to print messages.
**Details**

The function basically sends each `ConsensusPartition-class` object to `test_to_known_factors,ConsensusPartition-method` and merges results afterwards.

**Value**

A data frame with the following columns:

- number of samples used to test after filtered by `silhouette_cutoff`,
- p-values from the tests,
- number of subgroups.

If there are NA values, basically it means there are no efficient data points to perform the test.

Method dispatch page for `test_to_known_factors`.

**Dispatch**

`test_to_known_factors` can be dispatched on following classes:

- `test_to_known_factors,HierarchicalPartition-method,HierarchicalPartition-class` class method
- `test_to_known_factors,ConsensusPartition-method,ConsensusPartition-class` class method
- `test_to_known_factors,ConsensusPartitionList-method,ConsensusPartitionList-class` class method
- `test_to_known_factors,DownSamplingConsensusPartition-method,DownSamplingConsensusPartition-class` class method
Examples

# no example
NULL

Description

Test correspondence between predicted subgroups and known factors

Usage

## S4 method for signature 'DownSamplingConsensusPartition'
test_to_known_factors(object, k, known = get_anno(object),
                      p_cutoff = 0.05, verbose = FALSE)

Arguments

object A DownSamplingConsensusPartition-class object.
k Number of subgroups. It uses all k if it is not specified.
known A vector or a data frame with known factors. By default it is the annotation table set in consensus_partition_by_down_sampling.
p_cutoff Cutoff for p-values for the class prediction. Samples with p-value higher than it are omit.
verbose Whether to print messages.

Details

The test is performed by test_between_factors between the predicted classes and user's annotation table.

Value

A data frame with the following columns:

• number of samples used to test after filtered by p_cutoff,
• p-values from the tests,
• number of subgroups.

Author(s)

Zuguang Gu <z.gu@dkfz.de>
Examples

```r
data(golub_cola_ds)
test_to_known_factors(golub_cola_ds, k = 3)
test_to_known_factors(golub_cola_ds)
```

### Description

Test correspondence between predicted classes and known factors

#### Usage

```r
## S4 method for signature 'HierarchicalPartition'
test_to_known_factors(object, known = get_anno(object[1]),
merge_node = merge_node_param(), verbose = FALSE)
```

#### Arguments

- **object**: A HierarchicalPartition-class object.
- **merge_node**: Parameters to merge sub-dendrograms, see `merge_node_param`.
- **known**: A vector or a data frame with known factors. By default it is the annotation table set in `hierarchical_partition`.
- **verbose**: Whether to print messages.

#### Value

A data frame with columns:
- number of samples
- p-values from the tests
- number of classes

The classifications are extracted for each depth.

#### Author(s)

Zuguang Gu <z.gu@dkfz.de>

#### Examples

```r
data(golub_cola_rh)
# golub_cola_rh already has known annotations, so test_to_known_factors()
# can be directly applied
test_to_known_factors(golub_cola_rh)
```
**top_elements_overlap**

---

**Description**

Overlap of top elements from different metrics

**Usage**

```r
top_elements_overlap(object, top_n = round(0.25*length(object[[1]])),
                       method = c("euler", "upset", "venn", "correspondance"),
                       fill = NULL, ...)
```

**Arguments**

- `object`: A list which contains values from different metrics.
- `top_n`: Number of top rows.
- `method`: `euler`: plot Euler diagram by `euler`; `upset`: draw the Upset plot by `UpSet`;
  `venn`: plot Venn diagram by `venn`; `correspondance`: use `correspond_between_rankings`.
- `fill`: Filled color for the Euler diagram. The value should be a color vector. Transparency of 0.5 are added internally.
- `...`: Additional arguments passed to `plot.euler`, `UpSet` or `correspond_between_rankings`.

**Details**

The i’th value in every vectors in `object` should correspond to the same element from the original data.

**Value**

No value is returned.

**Author(s)**

Zuguang Gu <z.gu@dkfz.de>

**Examples**

```r
require(matrixStats)
set.seed(123)
mat = matrix(rnorm(1000), nrow = 100)
lt = list(sd = rowSds(mat), mad = rowMads(mat))
top_elements_overlap(lt, top_n = 20, method = "euler")
top_elements_overlap(lt, top_n = 20, method = "upset")
top_elements_overlap(lt, top_n = 20, method = "venn")
top_elements_overlap(lt, top_n = 20, method = "correspondance")
```
### Description

Heatmap of top rows

### Usage

```r
## S4 method for signature 'ConsensusPartition'
top_rows_heatmap(object, top_n = min(object@top_n), k = NULL,
                  anno = get_anno(object), anno_col = get_anno_col(object),
                  scale_rows = object@scale_rows, ...)
```

### Arguments

- `top_n`: Number of top rows.
- `k`: Number of subgroups. If it is not specified, it uses the "best k".
- `anno`: A data frame of annotations.
- `anno_col`: A list of colors (color is defined as a named vector) for the annotations. If `anno` is a data frame, `anno_col` should be a named list where names correspond to the column names in `anno`.
- `scale_rows`: Whether to scale rows.
- `...`: Pass to `top_rows_heatmap.matrix-method`.

### Value

No value is returned.

### Author(s)

Zuguang Gu <z.gu@dkfz.de>

### See Also

- `top_rows_heatmap.matrix-method`

### Examples

```r
data(golub_cola)
top_rows_heatmap(golub_cola[“ATC:skmeans”])
```
Heatmap of top rows from different top-value methods

Description
Heatmap of top rows from different top-value methods

Usage
```r
## S4 method for signature 'ConsensusPartitionList'
top_rows_heatmap(object, top_n = min(object@list[[1]]@top_n),
  anno = get_anno(object), anno_col = get_anno_col(object),
  scale_rows = object@list[[1]]@scale_rows, ...)
```

Arguments
- `object`: A `ConsensusPartitionList-class` object.
- `top_n`: Number of top rows.
- `anno`: A data frame of annotations for the original matrix columns. By default it uses the annotations specified in `run_all_consensus_partition_methods`.
- `anno_col`: A list of colors (color is defined as a named vector) for the annotations. If `anno` is a data frame, `anno_col` should be a named list where names correspond to the column names in `anno`.
- `scale_rows`: Whether to scale rows.
- `...`: Pass to `top_rows_heatmap,matrix-method`.

Value
No value is returned.

**top_rows_heatmap-HierarchicalPartition-method**

Heatmap of top rows from different top-value methods

**Description**

Heatmap of top rows from different top-value methods

**Usage**

```r
## S4 method for signature 'HierarchicalPartition'
top_rows_heatmap(object, top_n = min(object@list[[1]]@top_n),
    anno = get_anno(object), anno_col = get_anno_col(object),
    scale_rows = object@list[[1]]@scale_rows, ...)
```
Arguments

- **object**: A `HierarchicalPartition-class` object.
- **top_n**: Number of top rows.
- **anno**: A data frame of annotations for the original matrix columns. By default it uses the annotations specified in `hierarchical_partition`.
- **anno_col**: A list of colors (color is defined as a named vector) for the annotations. If `anno` is a data frame, `anno_col` should be a named list where names correspond to the column names in `anno`.
- **scale_rows**: Whether to scale rows.
- **...**: Pass to `top_rows_heatmap`, `matrix-method`

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

See Also

`top_rows_heatmap`, `matrix-method`

Examples

```r
# There is no example
NULL
```

### top_rows_heatmap-matrix-method

Heatmap of top rows from different top-value methods

#### Usage

```r
## S4 method for signature 'matrix'
top_rows_heatmap(object, all_top_value_list = NULL,
                 top_value_method = all_top_value_methods(),
                 bottom_annotation = NULL,
                 top_n = round(0.25*nrow(object)), scale_rows = TRUE, ...)
```
Arguments

- **object**
  A numeric matrix.
- **all_top_value_list**
  Top-values that have already been calculated from the matrix. If it is NULL the values are calculated by methods in `top_value_method` argument.
- **top_value_method**
  Methods defined in `all_top_value_methods`.
- **bottom_annotation**
  A `HeatmapAnnotation-class` object.
- **top_n**
  Number of top rows to show in the heatmap.
- **scale_rows**
  Whether to scale rows.
- **...**
  Pass to `Heatmap`.

Details

The function makes heatmaps where the rows are scaled (or not scaled) for the top n rows from different top-value methods.

The top n rows are used for subgroup classification in cola analysis, so the heatmaps show which top-value method gives better candidate rows for the classification.

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

```r
set.seed(123)
mat = matrix(rnorm(1000), nrow = 100)
top_rows_heatmap(mat, top_n = 25)
```

Description

Overlap of top rows from different top-value methods

Usage

```r
## S4 method for signature 'ConsensusPartitionList'
top_rows_overlap(object, top_n = min(object@list[[1]]@top_n),
    method = c("euler", "upset", "venn", "correspondance"), fill = NULL, ...)
```
Arguments

object  A ConsensusPartitionList-class object.
top_n  Number of top rows.
method  euler: plot Euler diagram by euler; upset: draw the Upset plot by UpSet; venn: plot Venn diagram by venn; correspondance: use correspond_between_rankings.
fill  Filled color for the Euler diagram. The value should be a color vector. Transparency of 0.5 are added internally.
...  Additional arguments passed to plot.euler, UpSet or correspond_between_rankings.

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

top_elements_overlap

Examples

data(golub_cola)
top_rows_overlap(golub_cola, method = "euler")
top_rows_overlap(golub_cola, method = "upset")
top_rows_overlap(golub_cola, method = "venn")
top_rows_overlap(golub_cola, method = "correspondance")

Description

Method dispatch page for top_rows_overlap.

Dispatch

top_rows_overlap can be dispatched on following classes:

- top_rows_overlap, HierarchicalPartition-method, HierarchicalPartition-class class method
- top_rows_overlap, matrix-method, matrix-class class method
- top_rows_overlap, ConsensusPartitionList-method, ConsensusPartitionList-class class method
Examples

# no example
NULL

top_rows_overlap-HierarchicalPartition-method

Overlap of top rows on different nodes

Description

Overlap of top rows on different nodes

Usage

## S4 method for signature 'HierarchicalPartition'
top_rows_overlap(object, method = c("euler", "upset", "venn"), fill = NULL, ...)

Arguments

object AHierarchicalPartition-class object.
method euler: plot Euler diagram by euler; upset: draw the Upset plot by UpSet;
venn: plot Venn diagram by venn; correspondance: use correspond_between_rankings.
fill Filled color for the Euler diagram. The value should be a color vector. Transparency of 0.5 are added internally.
... Additional arguments passed toplot.euler, UpSet or correspond_between_rankings.

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

See Also
top_elements_overlap

Examples
data(golub_cola_rh)
top_rows_overlap(golub_cola_rh, method = "euler")
top_rows_overlap(golub_cola_rh, method = "upset")
top_rows_overlap(golub_cola_rh, method = "venn")
top_rows_overlap-method

Description

Overlap of top rows from different top-value methods

Usage

```r
## S4 method for signature 'matrix'
top_rows_overlap(object, top_value_method = all_top_value_methods(),
    top_n = round(0.25*nrow(object)),
    method = c("euler", "upset", "venn", "correspondance"),
    fill = NULL, ...)
```

Arguments

- `object` A numeric matrix.
- `top_value_method` Methods defined in `all_top_value_methods`.
- `top_n` Number of top rows.
- `method` `euler`: plot Euler diagram by `euler`; `upset`: draw the Upset plot by `UpSet`;
  `venn`: plot Venn diagram by `venn`; `correspondance`: use `correspond_between_rankings`.
- `fill` Filled color for the Euler diagram. The value should be a color vector. Transparency of 0.5 are added internally.
- `...` Additional arguments passed to `plot.euler` or `correspond_between_rankings`.

Details

It first calculates scores for every top-value method and make plot by `top_elements_overlap`.

Value

No value is returned.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

See Also

top_elements_overlap
Examples

```
set.seed(123)
mat = matrix(rnorm(1000), nrow = 100)
top_rows_overlap(mat, top_n = 25)
```

Description

Subset a ConsensusPartitionList object

Usage

```
## S3 method for class 'ConsensusPartitionList'

x[i, j, drop = TRUE]
```

Arguments

- `x`: A `ConsensusPartitionList-class` object.
- `i`: Index for top-value methods, character or numeric.
- `j`: Index for partitioning methods, character or numeric.
- `drop`: Whether drop class

Details

For a specific combination of top-value method and partitioning method, you can also subset by e.g. `x['SD:hclust']`.

Value

A `ConsensusPartitionList-class` object or a `ConsensusPartition-class` object.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

```
data(golub_cola)
golub_cola[c("SD", "MAD"), c("hclust", "kmeans")]
golub_cola["SD", "kmeans"] # a ConsensusPartition object
golub_cola["SD:kmeans"] # a ConsensusPartition object
golub_cola[["SD:kmeans"]]] # a ConsensusPartition object
golub_cola["SD", "kmeans", drop = FALSE] # still a ConsensusPartitionList object
golub_cola["SD:kmeans", drop = FALSE] # still a ConsensusPartitionList object
```
Subset the HierarchicalPartition object

Description
Subset the HierarchicalPartition object

Usage

## S3 method for class 'HierarchicalPartition'
x[i]

Arguments

x A HierarchicalPartition-class object.
i Index. The value should be numeric or a node ID.

Details
On each node, there is a ConsensusPartition-class object.
Note you cannot get a sub-hierarchy of the partition.

Value
A ConsensusPartition-class object.

Examples

data(golub_cola_rh)
golub_cola_rh["01"]
Subset a ConsensusPartitionList object

Description

Subset a ConsensusPartitionList object

Usage

```r
## S3 method for class 'ConsensusPartitionList'
x[[i]]
```

Arguments

- `x`: A `ConsensusPartitionList-class` object.
- `i`: Character index for combination of top-value methods and partitioning method in a form of e.g. SD:kmeans.

Value

A `ConsensusPartition-class` object.

Author(s)

Zuguang Gu <z.gu@dkfz.de>

Examples

```r
data(golub_cola)
golub_cola[["SD:kmeans"]]
```

Subset the HierarchicalPartition object

Description

Subset the HierarchicalPartition object

Usage

```r
## S3 method for class 'HierarchicalPartition'
x[[i]]
```

```r
data(golub_cola)
golub_cola[["SD:kmeans"]]
```
HierarchicalPartition

Arguments

x      A `HierarchicalPartition-class` object
i      Index. The value should be numeric or a node ID.

Details

On each node, there is a `ConsensusPartition-class` object.

Note you cannot get a sub-hierarchy of the partition.

Value

A `ConsensusPartition-class` object.

Examples

```r
# There is no example
NULL
```
