Package `fgsea`

January 12, 2024

**Title**  Fast Gene Set Enrichment Analysis

**Version**  1.28.0

**Description**  The package implements an algorithm for fast gene set enrichment analysis. Using the fast algorithm allows to make more permutations and get more fine grained p-values, which allows to use accurate standard approaches to multiple hypothesis correction.

**biocViews**  GeneExpression, DifferentialExpression, GeneSetEnrichment, Pathways

**SystemRequirements**  C++11

**Depends**  R (>= 4.1)

**Imports**  Rcpp, data.table, BiocParallel, stats, ggplot2 (>= 2.2.0), cowplot, grid, fastmatch, Matrix, scales, utils

**Suggests**  testthat, knitr, rmarkdown, reactome.db, AnnotationDbi, parallel, org.Mm.eg.db, limma, GEOquery, msigdb, aggregation, Seurat

**License**  MIT + file LICENCE

**LazyData**  true

**LinkingTo**  Rcpp, BH

**RoxygenNote**  7.2.3

**Encoding**  UTF-8

**VignetteBuilder**  knitr

**URL**  https://github.com/ctlab/fgsea/

**BugReports**  https://github.com/ctlab/fgsea/issues

**git_url**  https://git.bioconductor.org/packages/fgsea

**git_branch**  RELEASE_3_18

**git_last_commit**  6c19b1e

**git_last_commit_date**  2023-10-24

**Repository**  Bioconductor 3.18

**Date/Publication**  2024-01-12
**Author**  Gennady Korotkevich [aut],
Vladimir Sukhov [aut],
Nikolay Budin [ctb],
Alexey Sergushichev [aut, cre]

**Maintainer**  Alexey Sergushichev <alsergbox@gmail.com>

**Index**  30
calcGseaStat

Calculates GSEA statistics for a given query gene set

Description

Takes $O(k \log k)$ time, where $k$ is a size of 'selectedSize'.

Usage

calcGseaStat(
  stats, selectedStats, gseaParam = 1,
  returnAllExtremes = FALSE,
  returnLeadingEdge = FALSE,
  scoreType = c("std", "pos", "neg")
)

Arguments

stats Named numeric vector with gene-level statistics sorted in decreasing order (order is not checked).

selectedStats Indexes of selected genes in the 'stats' array.

gseaParam GSEA weight parameter (0 is unweighted, suggested value is 1).

returnAllExtremes If TRUE return not only the most extreme point, but all of them. Can be used for enrichment plot

returnLeadingEdge If TRUE return also leading edge genes.

scoreType This parameter defines the GSEA score type. Possible options are ("std", "pos", "neg")

Value

Value of GSEA statistic if both returnAllExtremes and returnLeadingEdge are FALSE. Otherwise returns list with the following elements:

- res – value of GSEA statistic
- tops – vector of top peak values of cumulative enrichment statistic for each gene;
- bottoms – vector of bottom peak values of cumulative enrichment statistic for each gene;
- leadingGene – vector with indexes of leading edge genes that drive the enrichment, see http://software.broadinstitute.org/gsea/doc/GSEAUserGuideTEXT.htm#_Running_a_Leading.
Examples

data(exampleRanks)
data(examplePathways)
ranks <- sort(exampleRanks, decreasing=TRUE)
es <- calcGseaStat(ranks, na.omit(match(examplePathways[[1]], names(ranks))))

calcGseaStatBatchCpp  Calculates GSEA statistic values for all gene sets in 'selectedStats' list.

Description

Takes $O(n + mK\log K)$ time, where $n$ is the number of genes, $m$ is the number of gene sets, and $k$ is the mean gene set size.

Usage

calcGseaStatBatchCpp(stats, selectedGenes, geneRanks)

Arguments

stats  Numeric vector of gene-level statistics sorted in decreasing order
selectedGenes  List of integer vector with integer gene IDs (from 1 to n)
geneRanks  Integer vector of gene ranks

Value

Numeric vector of GSEA statistics of the same length as ‘selectedGenes’ list

collapsePathways  Collapse list of enriched pathways to independent ones.

Description

Collapse list of enriched pathways to independent ones.

Usage

collapsePathways(
  fgseaRes,
  pathways,
  stats,
  pval.threshold = 0.05,
  nperm = 10/pval.threshold,
  gseaParam = 1
)
collapsePathwaysGeseca

Arguments

- **fgseaRes**: Table with results of running fgsea(), should be filtered by p-value, for example by selecting ones with padj < 0.01.
- **pathways**: List of pathways, should contain all the pathways present in ‘fgseaRes’.
- **stats**: Gene-level statistic values used for ranking, the same as in ‘fgsea’.
- **pval.threshold**: Two pathways are considered dependent when p-value of enrichment of one pathways on background of another is greater than ‘pval.threshold’.
- **nperm**: Number of permutations to test for independence, should be several times greater than ‘1/pval.threshold’. Default value: ‘10/pval.threshold’.
- **gseaParam**: GSEA parameter, same as for ‘fgsea’.

Value

Named list with two elments: ‘mainPathways’ containing IDs of pathways not reducable to each other, and ‘parentPathways’ with vector describing for all the pathways to which ones they can be reduced. For pathways from ‘mainPathways’ vector ‘parentPathways’ contains ‘NA’ values.

Examples

data(examplePathways)
data(exampleRanks)
fgseaRes <- fgsea(examplePathways, exampleRanks, nperm=10000, maxSize=500)
collapsedPathways <- collapsePathways(fgseaRes[order(pval)][padj < 0.01],
exmaplePathways, exampleRanks)
mainPathways <- fgseaRes[pathway %in% collapsedPathways$mainPathways][
  order(-NES), pathway]

Description

Collapse list of enriched pathways to independent ones (GESECA version, highly experimental).

Usage

collapsePathwaysGeseca(
  gesecaRes,
  pathways,
  E,
  center = TRUE,
  scale = FALSE,
  eps = min(c(1e-50, gesecaRes$pval)),
  checkDepth = 10,
Arguments

gesecaRes
Table with results of running geseca(), should be filtered by p-value, for example by selecting ones with \( \text{padj} < 0.01 \).

pathways
List of pathways, should contain all the pathways present in 'gesecaRes'.

E
expression matrix, the same as in 'geseca'.

center
a logical value indicating whether the gene expression should be centered to have zero mean before the analysis takes place. The default is TRUE. The value is passed to scale.

scale
a logical value indicating whether the gene expression should be scaled to have unit variance before the analysis takes place. The default is FALSE. The value is passed to scale.

eps
eps parameter for internal gesecaMultilevel runs. Default: \( \text{min}(1e^{-50}, \text{gesecaRes$pval$}) \)

checkDepth
how much pathways to check against

nproc
If not equal to zero sets BPPARAM to use nproc workers (default = 0).

BPPARAM
Parallelization parameter used in bplapply.

collapsePathwaysORA
Collapse list of enriched pathways to independent ones. Version for ORA hypergeometric test.

Description
Collapse list of enriched pathways to independent ones. Version for ORA hypergeometric test.

Usage

collapsePathwaysORA(forRes, pathways, genes, universe, pval.threshold = 0.05)

Arguments

forRes
Table with results of running fgsea(), should be filtered by p-value, for example by selecting ones with \( \text{padj} < 0.01 \).

pathways
List of pathways, should contain all the pathways present in 'fgseaRes'.

genes
Set of query genes, same as in 'fora'

universe
A universe from which 'genes' were selected, same as in 'fora'

pval.threshold
Two pathways are considered dependent when p-value of enrichment of one pathways on background of another is greater then 'pval.threshold'.

nproc

BPPARAM

exampleExpressionMatrix

Value

Named list with two elements: ‘mainPathways’ containing IDs of pathways not reducable to each other, and ‘parentPathways’ with vector describing for all the pathways to which ones they can be reduced. For pathways from ‘mainPathways’ vector ‘parentPathways’ contains ‘NA’ values.

Examples

```r
data(examplePathways)
data(exampleRanks)
foraRes <- fora(examplePathways, genes=tail(names(exampleRanks), 200), universe=names(exampleRanks))
collapsedPathways <- collapsePathwaysORA(foraRes[order(pval)][padj < 0.01],
examplePathways,
genesis=tail(names(exampleRanks), 200),
universe=names(exampleRanks))

mainPathways <- foraRes[pathway %in% collapsedPathways$mainPathways][
    order(pval), pathway]
```

data(exampleRanks)

```
Example of expression values obtained for GSE14308.
```

Description

Example list of mouse Reactome pathways.

Example of expression values obtained for GSE14308.

Expression data was obtained by preprocessing the GSE14308 dataset. For the matrix of gene expression value, the following steps were performed:

- expression values were log2-scaled
- quantile-type normalization was performed between arrays
- rows were collapsed by ‘ENTREZID’
- rows were sorted in descending order by mean expression value per gene
- finally, top-10,000 genes were taken

The exact script is available as `system.file("gen_gse14308_expression_matrix.R", package="fgsea")`

Description

The list was obtained by selecting all the pathways from ‘reactome.db’ package that contain mouse genes. The exact script is available as `system.file("gen_reactome_pathways.R", package="fgsea")`
Description

The data were obtained by doing differential expression between Naive and Th1-activated states for GEO dataset GSE14308. The exact script is available as system.file("gen_gene_ranks.R", package=\"fgsea\")

fgsea

Wrapper to run methods for prerranked gene set enrichment analysis.

Description

This function provide an interface to two existing functions: fgseaSimple, fgseaMultilevel. By default, the fgseaMultilevel function is used for analysis. For compatibility with the previous implementation you can pass the 'nperm' argument to the function.

Usage

fgsea(
  pathways,  
  stats,  
  minSize = 1,  
  maxSize = length(stats) - 1,  
  gseaParam = 1,  
  ...
)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pathways</td>
<td>List of gene sets to check.</td>
</tr>
<tr>
<td>stats</td>
<td>Named vector of gene-level stats. Names should be the same as in 'pathways'</td>
</tr>
<tr>
<td>minSize</td>
<td>Minimal size of a gene set to test. All pathways below the threshold are excluded.</td>
</tr>
<tr>
<td>maxSize</td>
<td>Maximal size of a gene set to test. All pathways above the threshold are excluded.</td>
</tr>
<tr>
<td>gseaParam</td>
<td>GSEA parameter value, all gene-level statis are raised to the power of 'gseaParam'</td>
</tr>
<tr>
<td>...</td>
<td>optional arguments for functions fgseaSimple, fgseaMultilevel</td>
</tr>
</tbody>
</table>

Value

A table with GSEA results. Each row corresponds to a tested pathway.
fgseaLabel

Examples

data(examplePathways)
data(exampleRanks)
fgseaRes <- fgsea(examplePathways, exampleRanks, maxSize=500)
# Testing only one pathway is implemented in a more efficient manner
fgseaRes1 <- fgsea(examplePathways[1], exampleRanks)

fgseaLabel

Runs label-permuting gene set enrichment analysis.

Description

Runs label-permuting gene set enrichment analysis.

Usage

fgseaLabel(
  pathways,
  mat,
  labels,
  nperm,
  minSize = 1,
  maxSize = nrow(mat) - 1,
  nproc = 0,
  gseaParam = 1,
  BPPARAM = NULL
)

Arguments

pathways List of gene sets to check.
mat Gene expression matrix. Row name should be the same as in 'pathways'
labels Numeric vector of labels for the correlation score of the same length as the number of columns in 'mat'
nperm Number of permutations to do. Minimal possible nominal p-value is about 1/nperm
minSize Minimal size of a gene set to test. All pathways below the threshold are excluded.
maxSize Maximal size of a gene set to test. All pathways above the threshold are excluded.
nproc If not equal to zero sets BPPARAM to use nproc workers (default = 0).
gseaParam GSEA parameter value, all gene-level statis are raised to the power of 'gseaParam' before calculation of GSEA enrichment scores.
BPPARAM Parallelization parameter used in bplapply. Can be used to specify cluster to run. If not initialized explicitly or by setting 'nproc' default value 'bpparam()' is used.
Value

A table with GSEA results. Each row corresponds to a tested pathway. The columns are the following:

- pathway – name of the pathway as in 'names(pathway)';
- pval – an enrichment p-value;
- padj – a BH-adjusted p-value;
- ES – enrichment score, same as in Broad GSEA implementation;
- NES – enrichment score normalized to mean enrichment of random samples of the same size;
- nMoreExtreme' – a number of times a random gene set had a more extreme enrichment score value;
- size – size of the pathway after removing genes not present in 'names(stats)'.

Examples

library(limma)
library(GEOquery)
es <- getGEO("GSE19429", AnnotGPL = TRUE)[[1]]
exprs(es) <- normalizeBetweenArrays(log2(exprs(es)+1), method="quantile")
es <- es[!grepl("///", fData(es)$`Gene ID`), ]
es <- es[fData(es)$`Gene ID` != "", ]
es <- es[order(apply(exprs(es), 1, mean), decreasing=TRUE), ]
es <- es[!duplicated(fData(es)$`Gene ID`), ]
rownames(es) <- fData(es)$`Gene ID`

pathways <- reactomePathways(rownames(es))
mat <- exprs(es)
labels <- as.numeric(as.factor(gsub(" .*", "", es$title)))
fgseaRes <- fgseaLabel(pathways, mat, labels, nperm = 1000, minSize = 15, maxSize = 500)

fgseaMultilevel

Runs preranked gene set enrichment analysis.

Description

This feature is based on the adaptive multilevel splitting Monte Carlo approach. This allows us to exceed the results of simple sampling and calculate arbitrarily small P-values.
Usage

```r
fgseaMultilevel(
    pathways, 
    stats, 
    sampleSize = 101, 
    minSize = 1, 
    maxSize = length(stats) - 1, 
    eps = 1e-50, 
    scoreType = c("std", "pos", "neg"), 
    nproc = 0, 
    gseaParam = 1, 
    BPPARAM = NULL, 
    nPermSimple = 1000, 
    absEps = NULL
)
```

Arguments

- **pathways**: List of gene sets to check.
- **stats**: Named vector of gene-level stats. Names should be the same as in ‘pathways’
- **sampleSize**: The size of a random set of genes which in turn has size = pathwaySize
- **minSize**: Minimal size of a gene set to test. All pathways below the threshold are excluded.
- **maxSize**: Maximal size of a gene set to test. All pathways above the threshold are excluded.
- **eps**: This parameter sets the boundary for calculating the p value.
- **scoreType**: This parameter defines the GSEA score type. Possible options are ("std", "pos", "neg"). By default ("std") the enrichment score is computed as in the original GSEA. The "pos" and "neg" score types are intended to be used for one-tailed tests (i.e. when one is interested only in positive ("pos") or negative ("neg") enrichment).
- **nproc**: If not equal to zero sets BPPARAM to use nproc workers (default = 0).
- **gseaParam**: GSEA parameter value, all gene-level stats are raised to the power of ‘gseaParam’ before calculation of GSEA enrichment scores.
- **BPPARAM**: Parallelization parameter used in bplapply. Can be used to specify cluster to run. If not initialized explicitly or by setting ‘nproc’ default value ‘bpparam()’ is used.
- **nPermSimple**: Number of permutations in the simple fgsea implementation for preliminary estimation of P-values.
- **absEps**: deprecated, use ‘eps’ parameter instead

Value

A table with GSEA results. Each row corresponds to a tested pathway. The columns are the following
• pathway – name of the pathway as in ‘names(pathway)’;
• pval – an enrichment p-value;
• padj – a BH-adjusted p-value;
• log2err – the expected error for the standard deviation of the P-value logarithm.
• ES – enrichment score, same as in Broad GSEA implementation;
• NES – enrichment score normalized to mean enrichment of random samples of the same size;
• size – size of the pathway after removing genes not present in ‘names(stats)’.
• leadingEdge – vector with indexes of leading edge genes that drive the enrichment, see http://software.broadinstitute.org/gsea/doc/GSEAUserGuideTEXT.htm#_Running_a_Leading.

Examples

data(examplePathways)
data(exampleRanks)
fgseaMultilevelRes <- fgseaMultilevel(examplePathways, exampleRanks, maxSize=500)

fgseaSimple

Runs preranked gene set enrichment analysis.

Description

The function takes about $O(nk^{3/2})$ time, where $n$ is number of permutations and $k$ is a maximal size of the pathways. That means that setting ‘maxSize’ parameter with a value of ~500 is strongly recommended.

Usage

fgseaSimple(
  pathways, stats, nperm,
  minSize = 1, maxSize = length(stats) - 1, scoreType = c("std", "pos", "neg"),
  nproc = 0, gseaParam = 1, BPPARAM = NULL
)

Arguments

pathways List of gene sets to check.
stats Named vector of gene-level stats. Names should be the same as in ‘pathways’
nperm Number of permutations to do. Minimal possible nominal p-value is about 1/nperm
fgseaSimple

**minSize**  Minimal size of a gene set to test. All pathways below the threshold are excluded.

**maxSize**  Maximal size of a gene set to test. All pathways above the threshold are excluded.

**scoreType**  This parameter defines the GSEA score type. Possible options are ("std", "pos", "neg"). By default ("std") the enrichment score is computed as in the original GSEA. The "pos" and "neg" score types are intended to be used for one-tailed tests (i.e. when one is interested only in positive ("pos") or negative ("neg") enrichment).

**nproc**  If not equal to zero sets BPPARAM to use nproc workers (default = 0).

**gseaParam**  GSEA parameter value, all gene-level stats are raised to the power of 'gseaParam' before calculation of GSEA enrichment scores.

**BPPARAM**  Parallelization parameter used in bplapply. Can be used to specify cluster to run. If not initialized explicitly or by setting 'nproc' default value ‘bpparam()’ is used.

**Value**

A table with GSEA results. Each row corresponds to a tested pathway. The columns are the following:

- **pathway** – name of the pathway as in ‘names(pathway)’;
- **pval** – an enrichment p-value;
- **padj** – a BH-adjusted p-value;
- **ES** – enrichment score, same as in Broad GSEA implementation;
- **NES** – enrichment score normalized to mean enrichment of random samples of the same size;
- **nMoreExtreme** – a number of times a random gene set had a more extreme enrichment score value;
- **size** – size of the pathway after removing genes not present in ‘names(stats)’.
- **leadingEdge** – vector with indexes of leading edge genes that drive the enrichment, see http://software.broadinstitute.org/gsea/doc/GSEAUserGuideTEXT.htm#Running_a_Leading.

**Examples**

data(examplePathways)
data(exampleRanks)
fgseaRes <- fgseaSimple(examplePathways, exampleRanks, nperm=10000, maxSize=500)
# Testing only one pathway is implemented in a more efficient manner
fgseaRes1 <- fgseaSimple(examplePathways[1], exampleRanks, nperm=10000)
fgseaSimpleImpl

Runs preranked gene set enrichment analysis for preprocessed input data.

Description

Runs preranked gene set enrichment analysis for preprocessed input data.

Usage

```
fgseaSimpleImpl(
    pathwayScores,  
    pathwaysSizes,  
    pathwaysFiltered,  
    leadingEdges,  
    permPerProc,  
    seeds,  
    toKeepLength,  
    stats,  
    BPPARAM,  
    scoreType
)
```

Arguments

- `pathwayScores` Vector with enrichment scores for the 'pathways'.
- `pathwaysSizes` Vector of pathways sizes.
- `pathwaysFiltered` Filtered pathways.
- `leadingEdges` Leading edge genes.
- `permPerProc` Parallelization parameter for permutations.
- `seeds` Seed vector
- `toKeepLength` Number of 'pathways' that meet the condition for 'minSize' and 'maxSize'.
- `stats` Named vector of gene-level stats. Names should be the same as in 'pathways'
- `BPPARAM` Parallelization parameter used in bplapply.
- `scoreType` This parameter defines the GSEA score type. Possible options are ("std", "pos", "neg") Can be used to specify cluster to run. If not initialized explicitly or by setting 'nproc' default value 'bpparam()' is used.

Value

A table with GSEA results. Each row corresponds to a tested pathway. The columns are the following:

- pathway – name of the pathway as in 'names(pathway)';
• pval – an enrichment p-value;
• padj – a BH-adjusted p-value;
• ES – enrichment score, same as in Broad GSEA implementation;
• NES – enrichment score normalized to mean enrichment of random samples of the same size;
• nMoreExtreme’ – a number of times a random gene set had a more extreme enrichment score value;
• size – size of the pathway after removing genes not present in ‘names(stats)’.
• leadingEdge – vector with indexes of leading edge genes that drive the enrichment, see http://software.broadinstitute.org/gsea/doc/GSEAUserGuideTEXT.htm#_Running_a_Leading.

fora

Simple overrepresentation analysis based on hypergeometric test

Description

Simple overrepresentation analysis based on hypergeometric test

Usage

fora(pathways, genes, universe, minSize = 1, maxSize = length(universe) - 1)

Arguments

pathways List of gene sets to check.
genes Set of query genes
universe A universe from which ‘genes’ were selected
minSize Minimal size of a gene set to test. All pathways below the threshold are excluded.
maxSize Maximal size of a gene set to test. All pathways above the threshold are excluded.

Value

A table with ORA results. Each row corresponds to a tested pathway. The columns are the following:
• pathway – name of the pathway as in ‘names(pathway)’;
• pval – an enrichment p-value from hypergeometric test;
• padj – a BH-adjusted p-value;
• overlap – size of the overlap;
• size – size of the gene set;
• leadingEdge – vector with overlapping genes.
Examples

data(examplePathways)
data(exampleRanks)
foraRes <- fora(examplePathways, genes=tail(names(exampleRanks), 200), universe=names(exampleRanks))

geseca

Runs multilevel Monte-Carlo variant for performing gene sets coregulation analysis

Description

This function is based on the adaptive multilevel splitting Monte Carlo approach and allows to estimate arbitrarily small P-values for the task of analyzing variance along a set of genes.

Usage

geseca(
  pathways,
  E,
  minSize = 1,
  maxSize = nrow(E) - 1,
  center = TRUE,
  scale = FALSE,
  sampleSize = 101,
  eps = 1e-50,
  nproc = 0,
  BPPARAM = NULL,
  nPermSimple = 1000
)

Arguments

pathways List of gene sets to check.
E expression matrix, rows corresponds to genes, columns corresponds to samples.
minSize Minimal size of a gene set to test. All pathways below the threshold are excluded.
maxSize Maximal size of a gene set to test. All pathways above the threshold are excluded.
center a logical value indicating whether the gene expression should be centered to have zero mean before the analysis takes place. The default is TRUE. The value is passed to scale.
scale a logical value indicating whether the gene expression should be scaled to have unit variance before the analysis takes place. The default is FALSE. The value is passed to scale.
sampleSize sample size for conditional sampling.
gesecaSimple

eps
This parameter sets the boundary for calculating P-values.
nproc
If not equal to zero sets BPPARAM to use nproc workers (default = 0).
BPPARAM
Parallelization parameter used in bplapply.
nPermSimple
Number of permutations in the simple geseca implementation for preliminary estimation of P-values.

Value

A table with GESECA results. Each row corresponds to a tested pathway. The columns are the following

- pathway – name of the pathway as in ‘names(pathways)’;
- pctVar – percent of explained variance along gene set;
- pval – P-value that corresponds to the gene set score;
- padj – a BH-adjusted p-value;
- size – size of the pathway after removing genes not present in ‘rownames(E)’.

Examples

data("exampleExpressionMatrix")
data("examplePathways")
gr <- geseca(examplePathways, exampleExpressionMatrix, minSize=15, maxSize=500)

---

gesecaSimple

Runs simple variant for performing gene sets co-regulation analysis

Description

This function is based on the rude Monte Carlo sampling approach and P-value calculation accuracy is limited to ‘1 / nperm’ value.

Usage

gesecaSimple(
  pathways,
  E,
  minSize = 1,
  maxSize = nrow(E) - 1,
  center = TRUE,
  scale = FALSE,
  nperm = 1000,
  nproc = 0,
  BPPARAM = NULL
)
Arguments

pathways  List of gene sets to check.
E            expression matrix, rows corresponds to genes, columns corresponds to samples.
minSize     Minimal size of a gene set to test. All pathways below the threshold are excluded.
maxSize     Maximal size of a gene set to test. All pathways above the threshold are excluded.
center      a logical value indicating whether the gene expression should be centered to have zero mean before the analysis takes place. The default is TRUE. The value is passed to scale.
scale       a logical value indicating whether the gene expression should be scaled to have unit variance before the analysis takes place. The default is FALSE. The value is passed to scale.
nperm       Number of permutations to do. Minimal possible nominal p-value is about 1/nperm
nproc       If not equal to zero sets BPPARAM to use nproc workers (default = 0).
BPPARAM     Parallelization parameter used in bplapply.

Value

A table with GESECA results. Each row corresponds to a tested pathway. The columns are the following

• pathway – name of the pathway as in ‘names(pathways)’;
• pctVar – percent of explained variance along gene set;
• pval – P-value that corresponds to the gene set score;
• padj – a BH-adjusted p-value;
• size – size of the pathway after removing genes not present in ‘rownames(E)’.

Examples

data("exampleExpressionMatrix")
data("examplePathways")
gesecaRes <- gesecaSimple(examplePathways, exampleExpressionMatrix, minSize=15, maxSize=500)

---

gmtPathways

Returns a list of pathways from a GMT file.

Description

Returns a list of pathways from a GMT file.

Usage

gmtPathways(gmt.file)
mapIdsList

Arguments

gmt.file Path to a GMT file.

Value

A list of vectors with gene sets.

Examples

```r
pathways <- gmtPathways(system.file("extdata", "mouse.reactome.gmt", package="fgsea"))
```

Description

Efficiently converts collection of pathways using AnnotationDbi::mapIds function. Parameters are the same as for mapIds except for keys, which is assumed to be a list of vectors.

Usage

```r
mapIdsList(x, keys, column, keytype, ...)
```

Arguments

- `x`  the AnnotationDb object. But in practice this will mean an object derived from an AnnotationDb object such as an OrgDb or ChipDb object.
- `keys`  a list of vectors with gene ids
- `column`  the column to search on
- `keytype`  the keytype that matches the keys used
- `...`  other parameters passed to AnnotationDbi::mapIds

See Also

AnnotationDbi::mapIds

Examples

```r
library(org.Mm.eg.db)
data(exampleRanks)
fgseaRes <- fgsea(examplePathways, exampleRanks, maxSize=500, eps=1e-4)
fgseaRes[, leadingEdge := mapIdsList(org.Mm.eg.db, keys=leadingEdge, column="SYMBOL", keytype="ENTREZID")]
```
multilevelError

Calculates the expected error for the standard deviation of the P-value logarithm.

Description
Calculates the expected error for the standard deviation of the P-value logarithm.

Usage
multilevelError(pval, sampleSize)

Arguments
pval P-value
sampleSize equivalent to sampleSize in fgseaMultilevel

Value
The value of the expected error

Examples
expectedError <- multilevelError(pval=1e-10, sampleSize=1001)

multilevelImpl
Calculates P-values for preprocessed data.

Description
Calculates P-values for preprocessed data.

Usage
multilevelImpl(
multilevelPathwaysList,
stats,
sampleSize,
seed,
eps,
sign = FALSE,
BPPARAM = NULL
)

Arguments

- **multilevelPathwaysList**: List of pathways for which P-values will be calculated.
- **stats**: Named vector of gene-level stats. Names should be the same as in 'pathways'
- **sampleSize**: The size of a random set of genes which in turn has size = pathwaySize
- **seed**: 'seed' parameter from 'fgseaMultilevel'
- **eps**: This parameter sets the boundary for calculating the p value.
- **sign**: This option will be used in future implementations.
- **BPPARAM**: Parallelization parameter used in bplapply. Can be used to specify cluster to run. If not initialized explicitly or by setting ‘nproc’ default value ‘bpparam()’ is used.

Value

List of P-values.

---

**plotCoregulationProfile**

*Plots expression profile of a gene set*

Description

Plots expression profile of a gene set

Usage

```r
plotCoregulationProfile(
  pathway,
  E,
  center = TRUE,
  scale = FALSE,
  titles = colnames(E),
  conditions = NULL
)
```

Arguments

- **pathway**: Gene set to plot.
- **E**: matrix with gene expression values
- **center**: a logical value indicating whether the gene expression should be centered to have zero mean before the analysis takes place. The default is TRUE. The value is passed to `scale`.
- **scale**: a logical value indicating whether the gene expression should be scaled to have unit variance before the analysis takes place. The default is FALSE. The value is passed to `scale`.
plotCoregulationProfileReduction

titles sample titles to use for labels
conditions sample grouping to use for coloring

Value

ggplot object with the coregulation profile plot

Description

Plot a spatial expression profile of a gene set

Usage

plotCoregulationProfileReduction(
  pathway,
  object,
  title = NULL,
  assay = DefaultAssay(object),
  reduction = NULL,
  colors = c("darkblue", "lightgrey", "darkred"),
  guide = "colourbar",
  ...
)

Arguments

pathway Gene set to plot or a list of gene sets (see details below)
object Seurat object
title plot title
assay assay to use for obtaining scaled data, preferably with
reduction reduction to use for plotting (one of the ‘Seurat::Reductions(object)’)
colors vector of three colors to use in the color scheme
guide option for 'ggplot2::scale_color_gradientn' to control for presence of the color legend the same universe of genes in the scaled data
...

Value

ggplot object (or a list of objects) with the coregulation profile plot

When the input is a list of pathways, pathway names are used for titles. A list of ggplot objects a returned in that case.
plotCoregulationProfileSpatial

*Plot a spatial expression profile of a gene set*

**Description**

Plot a spatial expression profile of a gene set

**Usage**

plotCoregulationProfileSpatial(
  pathway,
  object,
  title = NULL,
  assay = DefaultAssay(object),
  colors = c("darkblue", "lightgrey", "darkred"),
  guide = "colourbar"
)

**Arguments**

- **pathway**: Gene set to plot or a list of gene sets (see details below)
- **object**: Seurat object
- **title**: plot title
- **assay**: assay to use for obtaining scaled data, preferably with the same universe of genes in the scaled data
- **colors**: vector of three colors to use in the color scheme
- **guide**: option for `ggplot2::scale_color_gradientn` to control for presence of the color legend the same universe of genes in the scaled data

**Value**

`ggplot` object (or a list of objects) with the coregulation profile plot

When the input is a list of pathways, pathway names are used for titles. A list of `ggplot` objects a returned in that case.
**plotEnrichment**

Plots GSEA enrichment plot. For more flexibility use `plotEnrichmentData` function.

**Description**

Plots GSEA enrichment plot. For more flexibility use `plotEnrichmentData` function.

**Usage**

```r
plotEnrichment(pathway, stats, gseaParam = 1, ticksSize = 0.2)
```

**Arguments**

- **pathway**: Gene set to plot.
- **stats**: Gene-level statistics.
- **gseaParam**: GSEA parameter.
- **ticksSize**: width of vertical line corresponding to a gene (default: 0.2)

**Value**

ggplot object with the enrichment plot.

**Examples**

```r
data(examplePathways)
data(exampleRanks)
## Not run:
plotEnrichment(examplePathways[["5991130_Programmed_Cell_Death"]],
               exampleRanks)
## End(Not run)
```

**plotEnrichmentData**

Returns data required for doing an enrichment plot.

**Description**

Returns data required for doing an enrichment plot.

**Usage**

```r
plotEnrichmentData(pathway, stats, gseaParam = 1)
```
plotEnrichmentData

**Arguments**

- **pathway** Gene set to plot.
- **stats** Gene-level statistics.
- **gseaParam** GSEA parameter.

**Value**

returns list with the following data: *‘curve’* - data.table with the coordinates of the enrichment curve; *‘ticks’* - data.table with statistic entries for each pathway gene, adjusted with gseaParam; *‘stats’* - data.table with statistic values for all of the genes, adjusted with gseaParam; *‘posES’, ‘negES’, ‘spreadES’* - values of the positive enrichment score, negative enrichment score, and difference between them; *‘maxAbsStat’* - maximal absolute value of statistic entries, adjusted with gseaParam.

**Examples**

```r
library(ggplot2)
data(examplePathways)
data(exampleRanks)
pd <- plotEnrichmentData(
    pathway = examplePathways[["5991130_Programmed_Cell_Death"]],
    stats = exampleRanks
)
with(pd,
    ggplot(data=curve) +
    geom_line(aes(x=rank, y=ES), color="green") +
    geom_ribbon(data=stats,
        mapping=aes(x=rank, ymin=0,
            ymax=stat/maxAbsStat*(spreadES/4)),
        fill="grey") +
    geom_segment(data=ticks,
        mapping=aes(x=rank, y=-spreadES/16,
            xend=rank, yend=spreadES/16),
        size=0.2) +
    geom_hline(yintercept=posES, colour="red", linetype="dashed") +
    geom_hline(yintercept=negES, colour="red", linetype="dashed") +
    geom_hline(yintercept=0, colour="black") +
    theme(
        panel.background = element_blank(),
        panel.grid.major=element_line(color="grey92")
    ) +
    labs(x="rank", y="enrichment score")
)
plotGesecaTable

Plots table of gene set profiles.

Description

Plots table of gene set profiles.

Usage

plotGesecaTable(
  gesecaRes,
  pathways,
  E,
  center = TRUE,
  scale = FALSE,
  colwidths = c(5, 3, 0.8, 1.2, 1.2),
  titles = colnames(E),
  colors = c("blue", "white", "red"),
  pathwayLabelStyle = NULL,
  headerLabelStyle = NULL,
  valueStyle = NULL,
  axisLabelStyle = NULL,
  axisLabelHeightScale = NULL
)

Arguments

gesecaRes          Table with geseca results.
pathways           Pathways to plot table, as in `geseca` function.
E                   gene expression matrix, as in `geseca` function.
center             a logical value indicating whether the gene expression should be centered to have zero mean before the analysis takes place. The default is TRUE. The value is passed to `scale`.
scale              a logical value indicating whether the gene expression should be scaled to have unit variance before the analysis takes place. The default is FALSE. The value is passed to `scale`.
colwidths          Vector of five elements corresponding to column width for grid.arrange. Can be both units and simple numeric vector, in latter case it defines proportions, not actual sizes. If column width is set to zero, the column is not drawn.
titles             sample titles to use an axis labels. Default to `colnames(E)`
colors             vector of three colors to use in the color scheme
pathwayLabelStyle  list with style parameter adjustments for pathway labels. For example, `list(size=10, color="red")` set the font size to 10 and color to red. See `cowplot::draw_text` for possible options.
headerLabelStyle
  similar to ‘pathwayLabelStyle’ but for the table header.
valueStyle
  similar to ‘pathwayLabelStyle’ but for pctVar and p-value columns.
axisLabelStyle
  list with style parameter adjustments for sample labels. See ‘ggplot2::element_text’ for possible options.
axisLabelHeightScale
  height of the row with axis labels compared to other rows. When set to ‘NULL’ the value is determined automatically.

Value
  ggplot object with gene set profile plots

---

**plotGseaTable**

*Plots table of enrichment graphs using ggplot and gridExtra.*

**Description**

Plots table of enrichment graphs using ggplot and gridExtra.

**Usage**

```r
plotGseaTable(
  pathways,
  stats,
  fgseaRes,
  gseaParam = 1,
  colwidths = c(5, 3, 0.8, 1.2, 1.2),
  pathwayLabelStyle = NULL,
  headerLabelStyle = NULL,
  valueStyle = NULL,
  axisLabelStyle = NULL,
  render = NULL
)
```

**Arguments**

- **pathways**: Pathways to plot table, as in ‘fgsea’ function.
- **stats**: Gene-level stats, as in ‘fgsea’ function.
- **fgseaRes**: Table with fgsea results.
- **gseaParam**: GSEA-like parameter. Adjusts displayed statistic values, values closer to 0 flatten plots. Default = 1, value of 0.5 is a good choice too.
- **colwidths**: Vector of five elements corresponding to column width for grid.arrange. Can be both units and simple numeric vector, in latter case it defines proportions, not actual sizes. If column width is set to zero, the column is not drawn.
pathwayLabelStyle
list with style parameter adjustments for pathway labels. For example, 'list(size=10, color="red")' set the font size to 10 and color to red. See 'cowplot::draw_text' for possible options.

headerLabelStyle
similar to 'pathwayLabelStyle' but for the table header.

valueStyle
similar to 'pathwayLabelStyle' but for NES and p-value columns.

axisLabelStyle
list with style parameter adjustments for stats axis labels. See 'ggplot2::element_text' for possible options.

render
(deprecated)

Value

ggplot object with enrichment barcode plots

Examples

data(examplePathways)
data(exampleRanks)
fgseaRes <- fgsea(examplePathways, exampleRanks, minSize=15, maxSize=500)
topPathways <- fgseaRes[head(order(pval), n=15)][order(NES), pathway]
plotGseaTable(examplePathways[topPathways], exampleRanks, fgseaRes, gseaParam=0.5)

reactomePathways

Returns a list of Reactome pathways for given Entrez gene IDs

Description

Returns a list of Reactome pathways for given Entrez gene IDs

Usage

reactomePathways(genes)

Arguments

genes Entrez IDs of query genes.

Value

A list of vectors with gene sets.

Examples

data(exampleRanks)
pathways <- reactomePathways(names(exampleRanks))
writeGmtPathways

writeGmtPathways(pathways, gmt.file)

Arguments

- **pathways**: a named list of vectors with gene ids
- **gmt.file**: name of the output file

Examples

data(examplePathways)
writeGmtPathways(examplePathways, tempfile("examplePathways", fileext=".gmt"))
