Package ‘flagme’

April 3, 2024

Version 1.58.0

Date 2015/04/06

Title Analysis of Metabolomics GC/MS Data

Author Mark Robinson <mark.robinson@imls.uzh.ch>, Riccardo Romoli <riccardo.romoli@unifi.it>

Maintainer Mark Robinson <mark.robinson@imls.uzh.ch>, Riccardo Romoli <riccardo.romoli@unifi.it>

Depends gcspikelite, xcms, CAMERA

Imports gplots, graphics, MASS, methods, SparseM, stats, utils

Description Fragment-level analysis of gas chromatography-massspectrometry metabolomics data.

addAMDISPeaks

Add AMDIS peak detection results

Description

Reads ASCII ELU-format files (output from AMDIS) and attaches them to an already created peaksDataset object.

Usage

addAMDISPeaks(object, fns = dir(, "[Eu][Ll][Uu]"), verbose = TRUE, ...)

Arguments

- **object**: a peaksDataset object.
- **fns**: character vector of same length as object@rawdata (user ensures the order matches).
- **verbose**: whether to give verbose output, default TRUE.
- **...**: arguments passed on to parseELU.

Details

Repeated calls to parseELU to add peak detection results to the original peaksDataset object.

Value

peaksDataset object

Author(s)

Mark Robinson

References

See Also

parseELU, peaksDataset
Examples

```r
# need access to CDF (raw data) and ELU files
require(gcspikelite)
gcmsPath<-paste(find.package("gcspikelite"),"data",sep="/")

# full paths to file names
cdfFiles<-dir(gcmsPath,"CDF",full=TRUE)
eluFiles<-dir(gcmsPath,"ELU",full=TRUE)
//# create a 'peaksDataset' object and add AMDIS peaks to it
pd<-peaksDataset(cdfFiles[1],mz=seq(50,550),rtrange=c(7.5,8.5))
pd<-addAMDISPeaks(pd,eluFiles[1])
```

---

**addChromaTOFPeaks**

*Add ChromaTOF peak detection results*

Description

Reads ASCII tab-delimited format files (output from ChromaTOF) and attaches them to an already created `peaksDataset` object.

Usage

```r
addChromaTOFPeaks(
  object,
  fns = dir(, "+Tt[Xx][Tx]\"),
  rtDivide = 60,
  verbose = TRUE,
  ...
)
```

Arguments

- **object**: a `peaksDataset` object.
- **fns**: character vector of same length as `object@rawdata` (user ensures the order matches)
- **rtDivide**: number giving the amount to divide the retention times by.
- **verbose**: whether to give verbose output, default `TRUE`
- **...**: arguments passed on to `parseChromaTOF`

Details

Repeated calls to `parseChromaTOF` to add peak detection results to the original `peaksDataset` object.
Value

peaksDataset object

Author(s)

Mark Robinson

parseChromaTOF, peaksDataset

Examples

# need access to CDF (raw data) and ChromaTOF files
require(gcspikelite)
gcmsPath<-paste(find.package("gcspikelite"),"data",sep="/")

# full paths to file names
cdfFiles<-dir(gcmsPath,"CDF",full=TRUE)
# [not run] cTofFiles<-dir(gcmsPath,"txt",full=TRUE)

# create a 'peaksDataset' object and add ChromaTOF peaks to it
pd<-peaksDataset(cdfFiles[1],mz=seq(50,550),rtrange=c(7.5,8.5))
# [not run] pd<-addChromTOFPeaks(pd,...)

addXCMSPeaks addXCMSPeaks

Description

Add xcms/CAMERA peak detection results

Usage

addXCMSPeaks(
  files,
  object,
  settings = list(),
  minintens = 100,
  minfeat = 6,
  BPPARAM = bpparam(),
  multipleMF = FALSE,
  multipleMFPParam = list(fwhm = c(5, 10, 15), mz.abs = 0.2, rt.abs = 2)
)
**Arguments**

- **files**
  - list of chromatogram files
- **object**
  - a peakDataset object
- **settings**
  - see `findPeaks-matchedFilter` `findPeaks-centWave`
- **minintens**
  - minimum ion intensity to be included into a pseudospectra
- **minfeat**
  - minimum number of ion to be created a pseudospectra
- **BPPARAM**
  - a parameter class specifying if and how parallel processing should be performed
- **multipleMF**
  - logical. Try to remove redundant peaks, in this case where there are any peaks within an absolute m/z value of 0.2 and within 3 s for any one sample in the xcmsSet (the largest peak is kept)
- **multipleMFPparam**
  - list. It contains the settings for the peak-picking. mz.abs represent the the mz range; rt.abs represent the rt range

**Details**

Reads the raw data using xcms, group each extracted ion according to their retention time using CAMERA and attaches them to an already created peaksDataset object.

Repeated calls to xcmsSet and annotate to perform peak-picking and deconvolution. The peak detection results are added to the original peaksDataset object. Two peak detection algorithms are available: continuous wavelet transform (peakPicking=c('cwt')) and the matched filter approach (peakPicking=c('mF')) described by Smith et al (2006). For further information consult the xcms package manual.

**Value**

- peaksDataset object

**Author(s)**

Riccardo Romoli <riccardo.romoli@unifi.it>

**See Also**

- `peaksDataset`
- `findPeaks-matchedFilter`

**Examples**

```r
files <- list.files(path = paste(find.package("gcspikelite"), "data", sep = "/"), "CDF", full = TRUE)
data <- peaksDataset(files[1:2], mz = seq(50, 550), rtrange = c(7.5, 8.5))
## create settings object
mfp <- xcms::MatchedFilterParam(fwhm = 10, snthresh = 5)
cwt <- xcms::CentWaveParam()
data <- addXCMSPeaks(files[1:2], data, settings = mfp, multipleMF = FALSE)
data
```
Data Structure for "between" alignment of many GCMS samples

Description

This function creates a "between" alignment (i.e. comparing merged peaks)

Usage

betweenAlignment(
  pD,  
  cAList,  
  pAList,  
  impList,  
  filterMin = 1,  
  gap = 0.7,  
  D = 10,  
  usePeaks = TRUE,  
  df = 30,  
  verbose = TRUE,  
  metric = 2,  
  type = 2,  
  penalty = 0.2,  
  compress = FALSE
)

Arguments

pD a peaksDataset object

cAList list of clusterAlignment objects, one for each experimental group

pAList list of progressiveAlignment objects, one for each experimental group

impList list of imputation lists

filterMin minimum number of peaks within a merged peak to be kept in the analysis

gap gap parameter

D retention time penalty parameter

usePeaks logical, whether to use peaks (if TRUE) or the full 2D profile alignment (if FALSE)

df distance from diagonal to calculate similarity

verbose logical, whether to print information

metric numeric, different algorithm to calculate the similarity matrix between two mass spectrum. metric=1 call normDotProduct(); metric=2 call ndpRT(); metric=3 call corPrt()

type numeric, two different type of alignment function

penalty penalization applied to the matching between two mass spectra if (t1-t2)>D

compress logical whether to compress the similarity matrix into a sparse format.
Details

betweenAlignment objects gives the data structure which stores the result of an alignment across several "pseudo" datasets. These pseudo datasets are constructed by merging the "within" alignments.

Value

betweenAlignment object

Author(s)

Mark Robinson

multipleAlignment

Examples

require(gcspikelite)
## see 'multipleAlignment'

calcTimeDiffs(pd, ca.full, verbose = TRUE)

Description

This function takes the set of all pairwise profile alignments and use these to estimate retention time shifts between each pair of samples. These will then be used to normalize the retention time penalty of the signal peak alignment.

Usage

calcTimeDiffs(pd, ca.full, verbose = TRUE)

Arguments

- **pd**: a peaksDataset object
- **ca.full**: a clusterAlignment object, fit with
- **verbose**: logical, whether to print out information
Details

Using the set of profile alignments,

Value

list of same length as ca.full@alignments with the matrices giving the retention time penalties.

Author(s)

Mark Robinson

peaksAlignment, clusterAlignment

Examples

```
require(gcspikelite)

# paths and files
gcmsPath <- paste(find.package("gcspikelite"), "data", sep="/")
cdffFiles <- dir(gcmsPath,"CDF",full=TRUE)
eluFiles <- dir(gcmsPath,"ELU",full=TRUE)

# read data, peak detection results
pd <- peaksDataset(cdffFiles[1:2],mz=seq(50,550),rtrange=c(7.5,8.5))
pd <- addAMDISPeaks(pd,eluFiles[1:2])

# pairwise alignment using all scans
fullca <- clusterAlignment(pd, usePeaks=FALSE, df=100)

# calculate retention time shifts
timedf <- calcTimeDiffs(pd, fullca)
```

---

**clusterAlignment**  
*Data Structure for a collection of all pairwise alignments of GCMS runs*

**Description**

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs
clusterAlignment

Usage

clusterAlignment(
  pD, 
  runs = 1:length(pD@rawdata), 
  timedf = NULL, 
  usePeaks = TRUE, 
  verbose = TRUE, 
  ...
)

Arguments

pD a peaksDataset object.

runs vector of integers giving the samples to calculate set of pairwise alignments over.

timedf list (length = the number of pairwise alignments) of matrices giving the expected time differences expected at each pair of peaks used with usePeaks=TRUE, passed to peaksAlignment.

usePeaks logical, TRUE uses peakdata list, FALSE uses rawdata list for computing similarity.

verbose logical, whether to print out info.

... other arguments passed to peaksAlignment.

Details

clusterAlignment computes the set of pairwise alignments.

Value

clusterAlignment object

corPrt  

Retention Time Penalized Correlation

Description

This function calculates the similarity of all pairs of peaks from 2 samples, using the spectra similarity and the retention time differences.

Usage

corPrt(d1, d2, t1, t2, D, penalty = 0.2)

Arguments

- **d1**: data matrix for sample 1
- **d2**: data matrix for sample 2
- **t1**: vector of retention times for sample 1
- **t2**: vector of retention times for sample 2
- **D**: retention time window for the matching
- **penalty**: penalization applied to the matching between two mass spectra if (t1-t2)>D
Details

Computes the Pearson correlation between every pair of peak vectors in the retention time window (D) and returns the similarity matrix.

Value

matrix of similarities

**distToLib**

**Description**
The function calculate the distance between each mas spec in the msp file and the aligned mass spec from each sampe

**Usage**
```
distToLib(mspLib, outList)
```

**Arguments**
- **mspLib**: a .msp file from NIST
- **outList**: an object from gatherInfo()
Details

Return the distance matrix

Value

the distance matrix between the mass spec and the aligned spec

Author(s)

Riccardo Romoli

---

dp  

*Dynamic programming algorithm, given a similarity matrix*

Description

This function calls C code for a bare-bones dynamic programming algorithm, finding the best cost path through a similarity matrix.

Usage

```r
dp(M, gap = 0.5, big = 1e+10, verbose = FALSE)
```

Arguments

- **M**: similarity matrix
- **gap**: penalty for gaps
- **big**: large value used for matrix margins
- **verbose**: logical, whether to print out information

Details

This is a pretty standard implementation of a bare-bones dynamic programming algorithm, with a single gap parameter and allowing only simple jumps through the matrix (up, right or diagonal).

Value

- **list** with element **match** with the set of pairwise matches.

```

eitherMatrix-class  A class description

Description

A class description

exportSpectra  exportSpectra

Description

Write the mass spectrum into a .msp file to be used in NIST search.

Usage

```r
exportSpectra(object, outList, spectra, normalize = TRUE)
```

Arguments

- **object**: an object of class "peaksDataset"
- **outList**: an object created using the gatherInfo() function
- **spectra**: numeric. The number of the mass spectra to be printed. It correspond to the number of the peak in the plot() and the number of the peak in the gatherInfo() list.
- **normalize**: logical. If the mass spectra has to be normalized to 100
**Details**

Write the mass spectrum into a .msp file to be used in NIST search.

**Value**

a .msp file

**Author(s)**

riccardo.romoli@unifi.com

**gatherInfo**  
*Gathers abundance informations from an alignment*

**Description**

Given an alignment table (indices of matched peaks across several samples) such as that within a `progressiveAlignment` or `multipleAlignment` object, this routine goes through the raw data and collects the abundance of each fragment peak, as well as the retention times across the samples.

**Usage**

```r
gatherInfo(
  pD,  
  obj,  
  newind = NULL,  
  method = c("apex"),  
  findmzind = TRUE,  
  useTIC = FALSE,  
  top = NULL,  
  intensity.cut = 0.05
)
```

**Arguments**

- `pD`: a peaksDataset object, to get the abundance data from
- `obj`: either a `multipleAlignment` or `progressiveAlignment` object
- `newind`: list giving the
- `method`: method used to gather abundance information, only apex implemented currently.
- `findmzind`: logical, whether to take a subset of all m/z indices
- `useTIC`: logical, whether to use total ion current for abundance summaries
- `top`: only use the top top peaks
- `intensity.cut`: percentage of the maximum intensity
gatherInfo

Details

This procedure loops through the the table of matched peaks and gathers the

Value

Returns a list (of lists) for each row in the alignment table. Each list has 3 elements:

- **mz**: a numerical vector of the m/z fragments used
- **rt**: a numerical vector for the exact retention time of each peak across all samples
- **data**: matrix of fragment intensities. If `useTIC = TRUE`, this matrix will have a single row

eluFiles <- dir(gcmsPath, "ELU", full = TRUE)

## read data, peak detection results
 pd <- peaksDataset(cdfFiles[1:2], mz = seq(50, 550), rtrange = c(7.5, 8.5))
 pd <- addAMDISPeaks(pd, eluFiles[1:2])

## multiple alignment
 ma <- multipleAlignment(pd, c(1,1), wn.gap = 0.5, wn.D = 0.05, bw.gap = 0.6,
                          bw.D = 0.2, usePeaks = TRUE, filterMin = 1, df = 50,
                          verbose = TRUE, metric = 1, type = 1)

## gather apex intensities
 d <- gatherInfo(pd, ma)

## table of retention times
 nm <- list(paste("MP", 1:length(d), sep = ""), c("S1", "S2"))
 rts <- matrix(unlist(sapply(d, .subset, "rt")), byrow = TRUE, nc = 2,
                dimnames = nm)
```
**headToTailPlot**

**Description**

The head-to-tail-plot for the mass spectra

**Usage**

```
headToTailPlot(specFromLib, specFromList)
```

**Arguments**

- `specFromLib` the mass spectra obtained from the .msp file
- `specFromList` the mass spectra obtained from `gatherInfo`

**Details**

Head-to-tail-plot to visually compare the mass spectra

**Value**

the plot

**Author(s)**

Riccardo Romoli

---

**importSpec**

**Description**

Read the mass spectra from an external msp file

**Usage**

```
importSpec(file)
```

**Arguments**

- `file` a .msp file from NIST search library database

**Details**

Read the mass spectra from an external file in msp format. The format is used in NIST search library database.
imputePeaks

Value

list containing the mass spectra

Author(s)

riccardo.romoli@unifi.it

---

**imputePeaks**

*Imputation of locations of peaks that were undetected*

**Description**

Using the information within the peaks that are matched across several runs, we can impute the location of the peaks that are undetected in a subset of runs.

**Usage**

```
imputePeaks(pD, obj, typ = 1, obj2 = NULL, filterMin = 1, verbose = TRUE)
```

**Arguments**

- **pD** a peaksDataset object
- **obj** the alignment object, either `multipleAlignment` or `progressiveAlignment`, that is used to infer the unmatched peak locations
- **typ** type of imputation to do, 1 for simple linear interpolation (default), 2 only works if `obj2` is a `clusterAlignment` object
- **obj2** a `clusterAlignment` object
- **filterMin** minimum number of peaks within a merged peak to impute
- **verbose** logical, whether to print out information

**Details**

If you are aligning several samples and for a (small) subset of the samples in question, a peak is undetected, there is information within the alignment that can be useful in determining where the undetected peak is, based on the surrounding matched peaks. Instead of moving forward with missing values into the data matrices, this procedures goes back to the raw data and imputes the location of the apex (as well as the start and end), so that we do not need to bother with post-hoc imputation or removing data because of missing components.

We realize that imputation is prone to error and prone to attributing intensity from neighbouring peaks to the unmatched peak. We argue that this is still better than having to deal with these in statistical models after that fact. This may be an area of future improvement.

**Value**

list with 3 elements apex, start and end, each masked matrices giving the scan numbers of the imputed peaks.

Data Structure for multiple alignment of many GCMS samples

Description

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs

Usage

multipleAlignment(
  pd,
  group,
  bw.gap = 0.8,
  wn.gap = 0.6,
  bw.D = 0.2,
  wn.D = 0.05,
  filterMin = 1,
  lite = FALSE,
  usePeaks = TRUE,
  df = 50,
  verbose = TRUE,
  timeAdjust = FALSE,
  doImpute = FALSE,
  metric = 2,
  type = 2,
  penalty = 0.2,
  compress = FALSE
)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pd</td>
<td>a peaksDataset object</td>
</tr>
<tr>
<td>group</td>
<td>factor variable of experiment groups, used to guide the alignment algorithm</td>
</tr>
<tr>
<td>bw.gap</td>
<td>gap parameter for &quot;between&quot; alignments</td>
</tr>
</tbody>
</table>
### multipleAlignment-class

- **wn.gap**  gap parameter for "within" alignments
- **bw.D**  distance penalty for "between" alignments. When type = 2 represent the retention time window expressed in seconds
- **wn.D**  distance penalty for "within" alignments. When type = 2 represent the retention time window expressed in seconds
- **filterMin**  minimum number of peaks within a merged peak to be kept in the analysis
- **lite**  logical, whether to keep "between" alignment details (default, FALSE)
- **usePeaks**  logical, whether to use peaks (if TRUE) or the full 2D profile alignment (if FALSE)
- **df**  distance from diagonal to calculate similarity
- **verbose**  logical, whether to print information
- **timeAdjust**  logical, whether to use the full 2D profile data to estimate retention time drifts (Note: time required)
- **doImpute**  logical, whether to impute the location of unmatched peaks
- **metric**  numeric, different algorithm to calculate the similarity matrix between two mass spectrum. metric=1 call normDotProduct(); metric=2 call ndpRT(); metric=3 call corPrt()  
- **type**  numeric, two different type of alignment function  
- **penalty**  penalization applied to the matching between two mass spectra if (t1-t2)>D  
- **compress**  logical whether to compress the similarity matrix into a sparse format.

### Details

multipleAlignment is the data structure giving the result of an alignment across several GCMS runs. Multiple alignments are done progressively. First, all samples with the same tg$Group label with be aligned (denoted a "within" alignment). Second, each group will be summarized into a pseudo-data set, essentially a spectrum and retention time for each matched peak of the within-alignment. Third, these "merged peaks" are aligned in the same progressive manner, here called a "between" alignment.

### Value

multipleAlignment object

### Author(s)

Mark Robinson

### References

peaksDataset, betweenAlignment, progressiveAlignment
Examples

```r
require(gcspikelite)

## paths and files
gcmsPath <- paste(find.package("gcspikelite"), "data", sep = "/")
cddfFiles <- dir(gcmsPath, "CDF", full = TRUE)
eluFiles <- dir(gcmsPath, "ELU", full = TRUE)

## read data, peak detection results
pd <- peaksDataset(cddfFiles[1:2], mz = seq(50, 550), rtrange = c(7.5, 8.5))
pd <- addAMDISPeaks(pd,eluFiles[1:2])

## multiple alignment
ma <- multipleAlignment(pd, c(1, 1), wn.gap = 0.5, wn.D = 0.05, bw.gap = 0.6,
                        bw.D = 0.2, usePeaks = TRUE, filterMin = 1, df = 50,
                        verbose = TRUE, metric = 1, type = 1)
```

---

**ndpRT**

*Retention Time Penalized Normalized Dot Product*

**Description**

This function calculates the similarity of all pairs of peaks from 2 samples, using the spectra similarity and the retention time differences.

**Usage**

```r
ndpRT(s1, s2, t1, t2, D)
```

**Arguments**

- `s1`: data matrix for sample 1
- `s2`: data matrix for sample 2
- `t1`: vector of retention times for sample 1
- `t2`: vector of retention times for sample 2
- `D`: retention time window for the matching

**Details**

Computes the normalized dot product between every pair of peak vectors in the retention time window (D) and returns a similarity matrix.

**Value**

matrix of similarities
normDotProduct

peaksAlignment

Examples

```r
## Not Run
require(gcspikelite)
files <- list.files(path = paste(find.package("gcspikelite"), "data", sep = "/"), "CDF", full = TRUE)
data <- peaksDataset(files[1:2], mz = seq(50, 550), rtrange = c(7.5, 8.5))
## create settings object
mfp <- xcms::MatchedFilterParam(fwhm = 10, snthresh = 5)
cwt <- xcms::CentWaveParam()
data <- addXCMSPeaks(files[1:2], data, settings = mfp, multipleMF = FALSE)
data
## review peak picking
plotChrom(data, rtrange = c(7.5, 10.5), runs = c(1:2))

r <- ndpRT(data@peaksdata[[1]], data@peaksdata[[2]], data@peaksrt[[1]], data@peaksrt[[2]], D = 50)
## End (Not Run)
```

normDotProduct  Normalized Dot Product

Description

This function calculates the similarity of all pairs of peaks from 2 samples, using the spectra similarity

Usage

```r
normDotProduct(
x1,
x2,
t1 = NULL,
t2 = NULL,
df = max(ncol(x1), ncol(x2)),
D = 1e+05,
timedf = NULL,
verbose = FALSE
)
```
Arguments

- **x1**: data matrix for sample 1
- **x2**: data matrix for sample 2
- **t1**: vector of retention times for sample 1
- **t2**: vector of retention times for sample 2
- **df**: distance from diagonal to calculate similarity
- **D**: retention time penalty
- **timedf**: matrix of time differences to normalize to. If NULL, 0 is used.
- **verbose**: logical, whether to print out information

Details

Efficiently computes the normalized dot product between every pair of peak vectors and returns a similarity matrix. C code is called.

Value

matrix of similarities

dp, peaksAlignment

Examples

```r
require(gcspikelite)

# paths and files
gcmsPath <- paste(find.package("gcspikelite"),"data",sep="/"

cdfFiles <- dir(gcmsPath,"CDF",full=TRUE)
eluFiles <- dir(gcmsPath,"ELU",full=TRUE)

# read data, peak detection results
pd <- peaksDataset(cdfFiles[1:2],mz=seq(50,550),rtrange=c(7.5,8.5))

pd <- addAMDISPeaks(pd,eluFiles[1:2])

r <- normDotProduct(pd@peaksdata[[1]],pd@peaksdata[[2]])
```
**parseChromaTOF**  
*Parser for ChromaTOF files*

---

**Description**

Reads ASCII ChromaTOF-format files from AMDIS (Automated Mass Spectral Deconvolution and Identification System)

**Usage**

```r
parseChromaTOF(
  fn,
  min.pc = 0.01,
  mz = seq(85, 500),
  rt.cut = 0.008,
  rtrange = NULL,
  skip = 1,
  rtDivide = 60
)
```

**Arguments**

- `fn` ChromaTOF filename to read.
- `min.pc` minimum percent of maximum intensity.
- `mz` vector of mass-to-charge bins of raw data table.
- `rt.cut` the difference in retention time, below which peaks are merged together.
- `rtrange` retention time range to parse peaks from, can speed up parsing if only interested in a small region (must be numeric vector of length 2)
- `skip` number of rows to skip at beginning of the ChromaTOF
- `rtDivide` multiplier to divide the retention times by (default: 60)

**Details**

`parseChromaTOF` will typically be called by `addChromaTOFPeaks`, not called directly.

Peaks that are detected within `rt.cut` are merged together. This avoids peaks which are essentially overlapping.

Fragments that are less than `min.pc` of the maximum intensity fragment are discarded.

**Value**

list with components `peaks` (table of spectra – rows are mass-to-charge and columns are the different detected peaks) and `tab` (table of features for each detection), according to what is stored in the ChromaTOF file.
Author(s)
Mark Robinson

# parse ChromaTOF file
cTofList<-parseChromaTOF(tofFiles[1])
```

---

parseELU

Parser for ELU files

Description

Reads ASCII ELU-format files from AMDIS (Automated Mass Spectral Deconvolution and Identification System)

Usage

```
parseELU(f, min.pc = 0.01, mz = seq(50, 550), rt.cut = 0.008, rtrange = NULL)
```

Arguments

- **f**  
  ELU filename to read.

- **min.pc**  
  minimum percent of maximum intensity.

- **mz**  
  vector of mass-to-charge bins of raw data table.

- **rt.cut**  
  the difference in retention time, below which peaks are merged together.

- **rtrange**  
  retention time range to parse peaks from, can speed up parsing if only interested in a small region (must be numeric vector of length 2)
peaksAlignment-class

Details

parseELU will typically be called by addAMDISPeaks, not called directly.

Peaks that are detected within rt.cut are merged together. This avoids peaks which are essentially overlapping.

Fragments that are less than min.pc of the maximum intensity fragment are discarded.

Value

list with components peaks (table of spectra – rows are mass-to-charge and columns are the different detected peaks) and tab (table of features for each detection), according to what is stored in the ELU file.

eluFiles<-dir(gcmsPath,"ELU",full=TRUE)

# parse ELU file
eluList<-parseELU(eluFiles[1])

peaksAlignment-class  Data Structure for pairwise alignment of 2 GCMS samples

Description

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs
Usage

peaksAlignment(
  d1,
  d2,
  t1,
  t2,
  gap = 0.5,
  D = 50,
  timedf = NULL,
  df = 30,
  verbose = TRUE,
  usePeaks = TRUE,
  compress = TRUE,
  metric = 2,
  type = 2,
  penalty = 0.2
)

Arguments

d1
  matrix of MS intensities for 1st sample (if doing a peak alignment, this contains peak apexes/areas; if doing a profile alignment, this contains scan intensities. Rows are m/z bins, columns are peaks/scans.

d2
  matrix of MS intensities for 2nd sample

t1
  vector of retention times for 1st sample

t2
  vector of retention times for 2nd sample

gap
  gap penalty for dynamic programming algorithm. Not used if type=2

D
  time window (on same scale as retention time differences, t1 and t2. Default scale is seconds.)

timedf
  list (length = the number of pairwise alignments) of matrices giving the expected time differences expected at each pair of peaks used with usePeaks=TRUE.

df
  integer, how far from the diagonal to go to calculate the similarity of peaks. Smaller value should run faster, but be careful not to choose too low.

verbose
  logical, whether to print out info.

usePeaks
  logical, TRUE uses peakdata list, FALSE uses rawdata list for computing similarity.

compress
  logical, whether to compress the similarity matrix into a sparse format.

metric
  numeric, different algorithm to calculate the similarity matrix between two mass spectrum. metric=1 call normDotProduct(); metric=2 call ndpRT(); metric=3 call corPrt()

type
  numeric, two different type of alignment function

penalty
  penalization applied to the matching between two mass spectra if (t1-t2)>D

Details

peaksAlignment is a hold-all data structure of the raw and peak detection data.

plot(data@peaksdata[[2]][,17], type = 'h', main = paste(data@peaksrt[[2]][[17]]))

## End (Not Run)
peaksDataset  

Data Structure for raw GCMS data and peak detection results

**Description**

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs

**Usage**

```r
peaksDataset(
  fns = dir(, "[Cc][Dd][Ff]"),
  verbose = TRUE,
  mz = seq(50, 550),
  rtDivide = 60,
  rtrange = NULL
)
```

**Arguments**

- `fns`  character vector, filenames of raw data in CDF format.
- `verbose`  logical, if TRUE then iteration progress information is output.
- `mz`  vector giving bins of raw data table.
- `rtDivide`  number giving the amount to divide the retention times by.
- `rtrange`  retention time range to limit data to (must be numeric vector of length 2)

**Details**

peaksDataset is a hold-all data structure of the raw and peak detection data.

**Value**

peaksDataset object

**Author(s)**

Mark Robinson

**References**

Examples

```r
require(gcspikelite)

# paths and files
gcmsPath <- paste(find.package("gcspikelite"), "data", sep = "/")
cdfFiles <- dir(gcmsPath, "CDF", full = TRUE)
eluFiles <- dir(gcmsPath, "ELU", full = TRUE)

# read data
pd <- peaksDataset(cdfFiles[1:2], mz = seq(50, 550), rtrange = c(7.5, 8.5))
show(pd)
```

Description

Plot the aligned mass spectra

Usage

```r
plotAlignedFrags(object, outList, specID, fullRange = TRUE, normalize = TRUE, ...)
```

Arguments

- **object**: where to keep the mass range of the experiment
- **outList**: where to keep the mass spectra; both abundance than m/z
- **specID**: a vector containing the index of the spectra to be plotted. Is referred to outList
- **fullRange**: if TRUE uses the mass range of the whole experiment, otherwise uses only the mass range of each plotted spectum
- **normalize**: if TRUE normalize the intensity of the mass peak to 100, the most abundant is 100% and the other peaks are scaled consequetially
- **...**: further arguments passed to the ‘plot’ command

Details

Plot the deconvoluted and aligned mass spectra collected using gatherInfo()
Author(s)

Riccardo Romoli (riccardo.romoli@unifi.it)

Examples

```r
files <- list.files(path = paste(find.package("gcspikelite"), "data", sep = "/"), "CDF", full = TRUE)
data <- peaksDataset(files[1:4], mz = seq(50, 550), rtrange = c(7.5, 8.5))## create settings object
mfp <- xcms::MatchedFilterParam(fwhm = 10, snthresh = 5)
cwt <- xcms::CentWaveParam(snthresh = 3, ppm = 3000, peakwidth = c(3, 40),
    prefilter = c(3, 100), fitgauss = FALSE, integrate = 2, noise = 0,
    extendLengthMSW = TRUE, mzCenterFun = "wMean")
data <- addXCMSPeaks(files[1:4], data, settings = mfp)
data## multiple alignment
ma <- multipleAlignment(data, c(1,1,2,2), wn.gap = 0.5, wn.D = 0.05,

    verbose = TRUE, metric = 2, type = 2)
## gather apex intensities
gip <- gatherInfo(data, ma)
gip[[33]]
plotAlignedFrags(object = data, outList = gip, specID = 33)
```

Description

Plotting functions for GCMS data objects

Usage

```r
## S4 method for signature 'peaksAlignment'
plotAlignment(
    object,
    xlab = "Peaks - run 1",
    ylab = "Peaks - run 2",
    plotMatches = TRUE,
    matchPch = 19,
    matchLwd = 3,
    matchCex = 0.5,
    matchCol = "black",
    col = colorpanel(50, "white", "green", "navyblue"),
    breaks = seq(0, 1, length = 51),
    ...
)
```
Arguments

- `object`: a `clusterAlignment` object
- `xlab`: x-axis label
- `ylab`: y-axis label
- `plotMatches`: logical, whether to plot matches
- `matchPch`: match plotting character
- `matchLwd`: match line width
- `matchCex`: match character expansion factor
- `matchCol`: match colour
- `col`: vector of colours for colourscale
- `breaks`: vector of breaks for colourscale
- `...`: further arguments passed to `image`

Details

Plot an object of `peaksAlignment`

The similarity matrix is plotted and optionally, the set of matching peaks. `clusterAlignment` objects are just a collection of all pairwise `peakAlignment` objects.

Value

plot an object of class `peaksAlignment`

                      compress = FALSE, type = 1, metric = 1,
                      gap = 0.5)
plotAlignment(pA)

---

plotChrom,peaksDataset-method

*Plotting functions for GCMS data objects*

---

**Description**

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs

**Usage**

```r
## S4 method for signature 'peaksDataset'
plotChrom(
  object,
  runs = 1:length(object@rawdata),
  mzind = 1:nrow(object@rawdata[[1]]),
  mind = NULL,
  plotSampleLabels = TRUE,
  calcGlobalMax = FALSE,
  peakCex = 0.8,
  plotPeaks = TRUE,
  plotPeakBoundaries = FALSE,
  plotPeakLabels = FALSE,
  plotMergedPeakLabels = TRUE,
  mlwd = 3,
  usePeaks = TRUE,
  plotAcrossRuns = FALSE,
  overlap = F,
  rtrange = NULL,
  cols = NULL,
  thin = 1,
  max.near = median(object@rawrt[[1]]),
  how.near = 50,
  scale.up = 1,
  ...
)
```
Arguments

object  a peaksDataset object.
runs    set of run indices to plot
mzind  set of mass-to-charge indices to sum over (default, all)
mind   matrix of aligned indices
plotSampleLabels logical, whether to display sample labels
calcGlobalMax logical, whether to calculate an overall maximum for scaling
peakCex character expansion factor for peak labels
plotPeaks logical, whether to plot hashes for each peak
plotPeakBoundaries logical, whether to display peak boundaries
plotPeakLabels logical, whether to display peak labels
plotMergedPeakLabels logical, whether to display 'merged' peak labels
mlwd    line width of lines indicating the alignment
usePeaks logical, whether to plot alignment of peaks (otherwise, scans)
plotAcrossRuns logical, whether to plot across peaks when unmatched peak is given
overlap logical, whether to plot TIC/XICs overlapping
rtrange vector of length 2 giving start and end of the X-axis
cols    vector of colours (same length as the length of runs)
thin    when usePeaks=FALSE, plot the alignment lines every thin values
max.near where to look for maximum
how.near how far away from max.near to look
scale.up a constant factor to scale the TICs
...     further arguments passed to the plot

Details

Each TIC is scale to the maximum value (as specified by the how.near and max.near values). The many parameters gives considerable flexibility of how the TICs can be visualized.

Value

plot the chromatograms

**progressiveAlignment-class**

*Data Structure for progressive alignment of many GCMS samples*

**Description**

Performs a progressive peak alignment (clustalw style) of multiple GCMS peak lists

**Usage**

```r
progressiveAlignment(
  pD,  
cA,  
  D = 50,  
gap = 0.5,  
  verbose = TRUE,  
  usePeaks = TRUE,  
  df = 30,  
  compress = FALSE,  
  type = 2
)
```

**Arguments**

- `pD`: a `peaksDataset` object
- `cA`: a `clusterAlignment` object
- `D`: retention time penalty
- `gap`: gap parameter
- `verbose`: logical, whether to print information
- `usePeaks`: logical, whether to use peaks (if `TRUE`) or the full 2D profile alignment (if `FALSE`)
- `df`: distance from diagonal to calculate similarity
- `compress`: logical, whether to store the similarity matrices in sparse form
- `type`: numeric, two different type of alignment function

**Details**

The progressive peak alignment we implemented here for multiple GCMS peak lists is analogous to how `clustalw` takes a set of pairwise sequence alignments and progressively builds a multiple alignment. More details can be found in the reference below.
Value

progressiveAlignment object

Author(s)

Mark Robinson

Examples

```r
require(gcspikelite)
files <- list.files(path = paste(find.package("gcspikelite"), "data",
sep = "/"), "CDF", full = TRUE)
data <- peaksDataset(files[1:2], mz = seq(50, 550), rtrange = c(7.5, 8.5))
## create settings object
mfp <- xcms::MatchedFilterParam(fwhm = 10, snthresh = 5)
cwt <- xcms::CentWaveParam(snthresh = 3, ppm = 3000, peakwidth = c(3, 40),
prefilter = c(3, 100), fitgauss = FALSE, integrate = 2, noise = 0,
extendLengthMSW = TRUE, mzCenterFun = "wMean")
data <- addXCMSPeaks(files[1:2], data, settings = mfp)
data
cia <- clusterAlignment(data, gap = 0.5, D = 0.05, df = 30, metric = 1,
type = 1, compress = FALSE)
apa <- progressiveAlignment(data, ca, gap = 0.6, D = 0.1, df = 30,
type = 1, compress = FALSE)
```

Description

Build a fat data matrix

Usage

```r
retFatMatrix(object, data, minFilter = round(length(object@files)/3 * 2))
```
Arguments

- **object**: peakDataset object
- **data**: a gatherInfo() object
- **minFilter**: the minimum number for a feature to be returned in the data matrix. Default is 2/3 of the samples

Details

This function allows to extract the data from an object created using gatherInfo and build a data matrix using the area of the deconvoluted and aligned peaks. The row are the samples while the column represent the different peaks.

Value

A fat data matrix containing the area of the deconvoluted and aligned peaks. The row are the samples while the column represent the different peaks.

Examples

```r
require(gcspikelite)
files <- list.files(path = paste(find.package("gcspikelite"), "data", sep = "/"),"CDF", full = TRUE)
data <- peaksDataset(files[1:2], mz = seq(50, 550), rtrange = c(7.5, 8.5))
## create settings object
mfp <- xcms::MatchedFilterParam(fwhm = 10, snthresh = 5)
cwt <- xcms::CentWaveParam(snthresh = 3, ppm = 3000, peakwidth = c(3, 40),
  prefilter = c(3, 100), fitgauss = FALSE, integrate = 2, noise = 0,
  extendLengthMSW = TRUE, mzCenterFun = "wMean")
data <- addXCMSPeaks(files[1:2], data, settings = mfp)
data
ma <- multipleAlignment(pd = data, group = c(1,1),
  filterMin = 1, metric = 2, type = 2)
outList <- gatherInfo(data, ma)
mtxD <- retFatMatrix(object = data, data = outList, minFilter = 1)
```
**rmaFitUnit**

*Fits a robust linear model (RLM) for one metabolite*

**Description**

Using `rlm` from MASS, this procedure fits a linear model using all the fragments.

**Usage**

```r
rmaFitUnit(
  u,  
  maxit = 5,  
  mzEffect = TRUE,
  cls = NULL,
  fitSample = TRUE,
  fitOrCoef = c("coef", "fit"),
  TRANSFORM = log2
)
```

**Arguments**

- `u` a metabolite unit (list object with vectors `mz` and `rt` for m/z and retention times, respectively and a `data` element giving the fragment×sample intensity matrix)
- `maxit` maximum number of iterations (default: 5)
- `mzEffect` logical, whether to fit m/z effect (default: TRUE)
- `cls` class variable
- `fitSample` whether to fit individual samples (alternative is fit by group)
- `fitOrCoef` whether to return a vector of coefficients (default: "coef"), or an `rlm` object ("fit")
- `TRANSFORM` function to transform the raw data to before fitting (default: log2)

**Details**

Fits a robust linear model.

**Value**

- list giving elements of fragment and sample coefficients (if `fitOrCoef="coef"`) or a list of elements from the fitting process (if `fitOrCoef="fit"`)

**show.multipleAlignment-method**

*Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs*

### Description

multipleAlignment is the data structure giving the result of an alignment across several GCMS runs. Multiple alignments are done progressively. First, all samples with the same $tg$Group label with be aligned (denoted a "within" alignment). Second, each group will be summarized into a pseudo-data set, essentially a spectrum and retention time for each matched peak of the within-alignment. Third, these "merged peaks" are aligned in the same progressive manner, here called a "between" alignment.

### Usage

```r
## S4 method for signature 'multipleAlignment'
show(object)
```
**show.multipleAlignment-method**

**Arguments**

object multipleAlignment object
