Package ‘frma’

February 26, 2024

Version  1.54.0
Date     2017-11-08
Title    Frozen RMA and Barcode
Description Preprocessing and analysis for single microarrays and microarray batches.
Author   Matthew N. McCall <mccallm@gmail.com>, Rafael A. Irizarry <rafa@jhu.edu>, with contributions from Terry Therneau
Maintainer Matthew N. McCall <mccallm@gmail.com>
Depends  R (>= 2.10.0), Biobase (>= 2.6.0)
Imports  Biobase, MASS, DBI, affy, methods, oligo, oligoClasses, preprocessCore, utils, BiocGenerics
Suggests hgu133afrmavvecs, frmaExampleData
biocViews  Software, Microarray, Preprocessing
License  GPL (>= 2)

**barcode**

*Gene Expression Barcode*

**Description**

This function converts expression values produced via fRMA to a gene expression barcode.

**Usage**

```r
barcode(object, platform=NULL, mu=NULL, tau=NULL, cutoff=6.5, output=“binary”)```

**Arguments**

- **object**
  a vector or matrix of expression values or an ExpressionSet or frmaExpressionSet produced by fRMA
- **platform**
  the platform of the input data. One of GPL96, GPL570, GPL571, GPL1261, GPL6244, GPL6246. Required if object is a vector or matrix and either mu or tau is NULL.
- **mu**
  the mean of the unexpressed distribution. If NULL then precomputed values are used if possible.
- **tau**
  the standard deviation of the unexpressed distribution. If NULL then precomputed values are used if possible.
- **cutoff**
  the lod score cutoff used if output is binary.
- **output**
  the desired values to be returned. Options are: p-value, z-score, lod, or binary.

**Value**

A matrix containing the type of output specified by the output parameter. The option *binary* creates a gene expression barcode where 1s denote expressed genes and 0s denote unexpressed genes. The option *p-value* returns the p-values for the expression values under the unexpressed distribution. The option *lod* returns the LOD scores for expression values under the unexpressed distribution. The option *z-score* returns the z-scores for the expression values under the unexpressed distribution.

**Author(s)**

Matthew N. McCall

**Examples**

```r
library(frma)
library(frmaExampleData)
data(AffyBatchExample)
object <- frma(AffyBatchExample)
bc <- barcode(object)```
Description

This function preprocesses an AffyBatch, ExonFeatureSet, or GeneFeatureSet object using the FRMA method.

Usage

frma(object, background="rma", normalize="quantile",
    summarize="robust_weighted_average", target="probeset",
    input.vecs=NULL, output.param=NULL, verbose=FALSE)

Arguments

object an AffyBatch, ExonFeatureSet, or GeneFeatureSet
background type of background correction to perform: either "none" or "rma".
normalize type of normalization to perform: either "none" or "quantile".
summarize type of summarization to perform: one of "median\_polish", "average", "median", "weighted\_average", "robust\_weighted\_average", "random\_effect".
target summarization level for exon and gene arrays. Must be one of: probeset, core, full (exon only), extended (exon only).
input.vecs a list of vectors to be used in preprocessing. If NULL, the correct package with pre-made vectors is loaded if it has been installed. These packages are of the form: <platform>frmavecs.
output.param a vector of output elements to return. By default only the expression values and standard errors (if applicable) are returned. Additional options are: "residuals", "weights", "random\_effects"
verbose logical value. If TRUE then some messages are displayed while the function runs.

Value

The function returns an ExpressionSet if output.param=NULL or an frmaExpressionSet otherwise.

Examples

library(frmaExampleData)
data(AffyBatchExample)
object <- frma(AffyBatchExample)
frmaExpressionSet-class

Class to Contain and Describe High-Throughput Expression Level Assays preprocessed with fRMA

Description

This is a class representation for fRMA-preprocessed expression data. `frmaExpressionSet` class is derived from `ExpressionSet`, and requires a matrix named `exprs` and optionally matrices named `se.exprs`, `weights`, and `residuals`.

Extends

Extends class `ExpressionSet`.

Creating Objects

```r
new("frmaExpressionSet", exprs = new("matrix"), se.exprs = new("matrix"), weights=new("matrix"), residuals=new("matrix"), randomeffects=new("matrix"), phenoData = new("AnnotatedDataFrame"), featureData = new("AnnotatedDataFrame"), experimentData = new("MIAME"), annotation = new("character"), ...)
```

This creates a `frmaExpressionSet` with `assayData` implicitly created to contain `exprs` and `se.exprs`. The only required named arguments is `exprs`. Three optional named matrices, `weights`, `residuals`, and `randomeffects` can be added to the object.

```r
new("frmaExpressionSet", assayData = assayDataNew(exprs=new("matrix"), se.exprs=new("matrix")), weights=new("matrix"), residuals=new("matrix"), randomeffects=new("matrix"), phenoData = new("AnnotatedDataFrame"), featureData = new("AnnotatedDataFrame"), experimentData = new("MIAME"), annotation = new("character"), ...)
```

This creates a `frmaExpressionSet` with `assayData` provided explicitly. In this form, the only required named argument is `assayData`. Three optional named matrices, `weights`, `residuals`, and `randomeffects` can be added to the object.

Slots

- `se.exprs`: standard errors for the expression estimates
- `weights`: weights used in the summarization step
- `residuals`: residuals from fitting the probe-level model
- `randomeffects`: random effect estimates from fitting the probe-level model using random effect summarization

Inherited from `ExpressionSet`:

- `assayData`: Contains matrices with equal dimensions, and with column number equal to `nrow(phenoData)`. `assayData` must contain a matrix `exprs` with rows representing features and columns representing samples. It may also contain a matrix `se.exprs` containing standard errors.
- `phenoData`: See `eSet`
annotation: See eSet
featureData: See eSet
experimentData: See eSet

Methods

Class-specific methods:

se.exprs(frmaExpressionSet) Access elements named se.exprs in the AssayData-class slot.
weights(frmaExpressionSet) Access elements named weights
residuals(frmaExpressionSet) Access elements named residuals
randomeffects(frmaExpressionSet) Access elements named randomeffects

For derived methods (see ExpressionSet).

See Also
eSet-class, ExpressionSet-class, frma.

Examples

# create an instance of frmaExpressionSet
new("frmaExpressionSet")

Description

Computes the generalized normalized unscaled standard error (a measure of microarray quality).

Usage

GNUSE(object, medianSE=NULL, type=c("plot", "values", "stats", "density"), ...)

Arguments

object an ExpressionSet or frmaExpressionSet containing standard errors produced by frma
medianSE median standard errors to be used. If NULL, these are obtained from the correct frmavecs package.
type the desired output
... additional graphical parameters for types plot or density
Value

If type is plot, boxplots of GNUSE values are displayed. If type is values, the GNUSE values are returned. If type is stats, the median, IQR, 95th, and 99th percentiles are reported. If type is density, a density plots of GNUSE values are displayed.

Matthew N. McCall

Examples

library(frma)
library(frmaExampleData)
data(AffyBatchExample)
object <- frma(AffyBatchExample)
GNUSE(object, type="stats")
