Package ‘geNetClassifier’

March 22, 2024

Type Package

Title Classify diseases and build associated gene networks using gene expression profiles

Version 1.42.0

Date 2020-04-02

Maintainer Sara Aibar <saibar@usal.es>

Depends R (>= 2.10.1), Biobase (>= 2.5.5), EBarrays, minet, methods

Imports e1071, graphics, grDevices

Suggests leukemiasEset, RUnit, BiocGenerics

Enhances RColorBrewer, igraph, infotheo

Description Comprehensive package to automatically train and validate a multi-class SVM classifier based on gene expression data. Provides transparent selection of gene markers, their coexpression networks, and an interface to query the classifier.

License GPL (>= 2)

ZipData no

### Description

Comprehensive package to automatically train a multi-class SVM classifier based on gene expression data. Provides transparent selection of gene markers, their coexpression networks, and an interface to query the classifier.
Details

Package: geNetClassifier
Type: Package
Version: 1.0
Date: 2013-02-28
License: GPL (>=2)
LazyLoad: yes
Depends: R (>= 2.10.1), Biobase (>= 2.5.5), EBarrays, minet, methods
Imports: e1071, ipred, graphics
Suggests: leukemiasEset
Enhances: RColorBrewer, igraph

Author(s)

---

**calculateGenesRanking  Calculate GenesRanking**

**Description**

Calculates the genes ranking and/or plots the posterior probability of the genes ordered by class ranking.

**Usage**

```r
calculateGenesRanking(eset=NULL, sampleLabels=NULL, numGenesPlot=1000, plotTitle="Significant genes", plotLp=TRUE, lpThreshold = 0.95, numSignificantGenesType="ranked", returnRanking="full", nullHypothesisFilter=0.95, nGenesExprDiff=1000, geneLabels=NULL, precalcGenesRanking=NULL, IQRfilterPercentage= 0, verbose=TRUE)
```

**Arguments**

- `eset` ExpressionSet or Matrix. Gene expression of the train samples (positive & non-logaritmic normalized values).
- `sampleLabels` Character. PhenoData variable (column name) containing the train samples class labels. Matrix or Factor. Class labels of the train samples.
- `numGenesPlot` Integer. Number of genes to plot.
- `plotTitle` Character. Plot title.
- `plotLp` Logical. If FALSE no plot is drawn.
- `lpThreshold` Numeric between 0 and 1. Required posterior probability value to consider a gene 'significant'.
- `numSignificantGenesType` Character. Type of count for number of genes over lpThreshold.
  - "global". Counts all genes of a class with posterior probability over lpThreshold, even if in the final ranking they were assigned to another class.
  - "ranked". Counts only genes assigned to each class.
- `returnRanking` Character. Type of ranking to return:
  - "full". Ranking of all available genes.
  - "lp"/"significant"/"lpThreshold"/TRUE. Ranking of the significant genes (genes with posterior probability over lpThreshold).
  - FALSE/NULL. No ranking is returned.
nullHypothesisFilter
    Numeric between 0 and 1. Genes with a Null Hypothesis with a posterior probability over this threshold will be removed from the ranking.
    Null Hypothesis: They don’t represent any class.

nGenesExprDiff Numeric. Number of top genes to calculate the differential expression for.

geneLabels Vector or Matrix. Gene name, ID or label which should be shown in the returned results and plots.

IQRfilterPercentage Integer. InterQuartile Range (IQR) filter applied to the initial data. Not recommended for more than two classes.

precalcGenesRanking
    Allows providing a genesRanking provided by geNetClassifier or by a previous execution for the same data and parameters.

verbose Logical. If TRUE, messages indicating the execution progress will be printed on screen.

Details

Significant genes: Genes with posterior probability over ‘lpThreshold’.
More significant genes may mean:

- Very different class
- More systemic disease

Plot lines represent the posterior probability of genes, sorted by rank from left to right.

In order to find genes that differentiate the classes from each other, the function ranks the genes based on their posterior probability for each class.
The posterior probability represents how well a gene differentiates samples from a class, from samples from other classes. Therefore, Genes with high posterior probability are good to differentiate a class from all the others.
This posterior probability is calculated by `emfit (pkg:EBarrays)`, an expectation-maximization (EM) algorithm for gene expression mixture model.

Value

- `GenesRanking` Optional. Requested genes ranking.
- Plot Optional. Plot of the posterior probability of the top genes.

See Also

`plot.GenesRanking` is a shortcut to plotting a previously calculated genes ranking.
i.e. `plot(genesRanking)`
Examples

# Load an expressionSet:
library(leukemiasEset)
data(leukemiasEset)

# Select the train samples:
# summary(leukemiasEset$LeukemiaType[trainSamples])

## Not run:
#####
# Calculate/plot the significant genes (+ info) of a dataset
# without training classifier/calculating network
#####
# Return only significant genes ranking (default)
signGenesRanking <- calculateGenesRanking(leukemiasEset[,trainSamples],
                                          sampleLabels="LeukemiaType")
numGenes(signGenesRanking)

# Return the full genes ranking:
fullRanking <- calculateGenesRanking(leukemiasEset[,trainSamples],
                                          sampleLabels="LeukemiaType", returnRanking="full")
numGenes(fullRanking)
numSignificantGenes(fullRanking)
# The significant genes can then be extracted from it:
signGenesRanking2 <- getTopRanking(fullRanking,
                                        numGenesClass=numSignificantGenes(fullRanking))
numGenes(signGenesRanking2)

# Changing the posterior probability required to consider genes significant:
signGenesRanking90 <- calculateGenesRanking(leukemiasEset[,trainSamples],
                                              sampleLabels="LeukemiaType", lpThreshold=0.9)
numGenes(signGenesRanking90)

## End(Not run)
#####
# Ploting previously calculated rankings:
#####
# Load or calculate a ranking (or a classifier with geNetClassifier)
data(leukemiasClassifier) # Sample trained classifier, @genesRanking

# Default plot:
# - equivalent to plot(leukemiasClassifier@genesRanking)
# - in this case, the previously calculated 'fullRanking'
#  is equivalent to 'leukemiasClassifier@genesRanking'
calculateGenesRanking(precalcGenesRanking=leukemiasClassifier@genesRanking)

# Changing arguments:
calculateGenesRanking(precalcGenesRanking=leukemiasClassifier@genesRanking,
                       numGenesPlot=5000, plotTitle="Leukemias", lpThreshold=0.9)
Probability matrix.

**Description**

Generates the probability matrix.

**Usage**

```
externalValidation.probMatrix(queryResult, realLabels, numDecimals=2)
```

**Arguments**

- `queryResult`: Object returned by `queryGeNetClassifier`
- `realLabels`: Factor. Actual/real class of the samples.
- `numDecimals`: Integer. Number of decimals to return.

**Details**

A probability matrix contains the probabilities of assigning each assigned sample to each class. They help identifying where errors are likely to occur even though there were not actual errors in the external/cross validation.

**Value**

The probability matrix.

**Author(s)**

**See Also**

- Main package function and classifier training: `geNetClassifier`
- Query the classifier: `queryGeNetClassifier`
- Query summary: `querySummary`
- External validation stats: `externalValidation.stats`

**Examples**

```
# Load an expressionSet:
library(leukemiasEset)
```
data(leukemiasEset)

# Select the train samples:
# summary(leukemiasEset$LeukemiaType[trainSamples])

# Train a classifier or load a trained one:
# leukemiasClassifier <- geNetClassifier(leukemiasEset[,trainSamples],
# sampleLabels="LeukemiaType", plotsName="leukemiasClassifier")
data(leukemiasClassifier) # Sample trained classifier

##########################
## External Validation
##########################
# Select the samples to query the classifier
# - External validation: samples not used for training
testSamples <- c(1:60)[-trainSamples]

# Make a query to the classifier:
queryResult <- queryGeNetClassifier(leukemiasClassifier, leukemiasEset[,testSamples])

# Obtain the probability matrix for the assigned samples:
externalValidation.probMatrix(queryResult, leukemiasEset[,testSamples]$LeukemiaType)

---

externalValidation.stats

*Statistics of the external validation.*

**Description**

Taking as input the confusion matrix resulting from external validation calculates the global Accuracy, Call Rate, Sensitivity, Specificity and Matthews Correlation Coefficient.

**Usage**

`externalValidation.stats(confussionMatrix, numDecimals = 2)`

**Arguments**

- `confussionMatrix`: Confusion matrix containing the real class as rows and the assigned class as columns.
- `numDecimals`: Integer. Number of decimals to show on the statistics.

**Value**

List:
- global General classifier stats.
  Accuracy: Percentage of correctly assigned samples within all assigned samples.
  CallRate: Percentage of samples which were assigned to a class.
- byClass Stats by class.
  Sensitivity: Percentage of samples of each class which were correctly identified (Rate of true positives)
  Specificity: Percentage of samples assigned to a given class that really belonged to the class (Rate of true negatives)
  MCC (Matthews Correlation Coefficient): Measure which takes into account both, true and false positives and negatives. (100%: Perfect assignments) confMatrix Confusion matrix.

Querying the classifier: queryGeNetClassifier
Generating the probability matrix: externalValidation.probMatrix

Examples

```
# Classifier training

# Load an expressionSet:
library(leukemiasEset)
data(leukemiasEset)

# Select the train samples:
# summary(leukemiasEset$LeukemiaType[trainSamples])

# Train a classifier or load a trained one:
leukemiasClassifier <- geNetClassifier(leukemiasEset[,trainSamples],
  sampleLabels="LeukemiaType", plotsName="leukemiasClassifier")
data(leukemiasClassifier) # Sample trained classifier

# External Validation:

# Select the samples to query the classifier
# - External validation: samples not used for training
testSamples <- c(1:68)[-trainSamples]

# Make a query to the classifier:
queryResult <- queryGeNetClassifier(leukemiasClassifier, leukemiasEset[,testSamples])
```
# Create the confusion matrix
confMatrix <- table(leukemiasEset[,testSamples]$LeukemiaType,queryResult$class)

# Calculate its accuracy, call rate, sensitivity and specificity:
externalValidation.stats(confMatrix)

gClasses-methods

Classes in the ranking.

Description
Returns the names of the classes in a GenesRanking

Methods
signature(object = "GenesRanking")

See Also
Main package function and classifier training: geNetClassifier
This method’s class (GenesRanking) help page.

Examples
data(leukemiasClassifier)
gClasses(leukemiasClassifier@genesRanking)

GeneralizationError-class

Class "GeneralizationError" (slot of GeNetClassifierReturn)

Description
Contains the estimation of the Generalization Error and the gene stats for geNetClassifier executed with the given data and parameters. Calculated by 5-fold cross-validation.

Slots
accuracy: "Matrix". Accuracy and call rate.
sensitivitySpecificity: "Matrix". Sensitivity, Specificity, Matthews Correlation Coefficient and Call Rate for each of the classes.
probMatrix: "Matrix". Probabilities of belonging to each class for the assigned samples. Helps identifying where errors are likely to occur even though there were not actual errors in the cross-validation.
querySummary: "List". Stats regarding the probability and number of assigned test samples to each class.

classificationGenes.stats: "List". Some basic statistics regarding the chosen genes.

classificationGenes.num: "Matrix". Number of genes used for each of the 5 cross-validation classifiers.

Methods

  overview signature(object = "GeneralizationError"): Shows an overview of all the slots in the object.

Examples

  ######
  # Load data and train a classifier
  ######

  # Load an expressionSet:
  library(leukemiasEset)
  data(leukemiasEset)

  # Select the train samples:
  # summary(leukemiasEset$LeukemiaType[trainSamples])

  # Train a classifier or load a trained one:
  # Note: Required 'estimateGError=TRUE'
  # leukemiasClassifier <- geNetClassifier(leukemiasEset[,trainSamples],
  #   sampleLabels="LeukemiaType", plotsName="leukemiasClassifier",
  #   estimateGError=TRUE)
  data(leukemiasClassifier) # Sample trained classifier

  # Global view of the returned object and its structure:
  leukemiasClassifier
  names(leukemiasClassifier)

  ######
  # Exploring the cross validation stats
  # Note: Required 'estimateGError=TRUE' in geNetClassifier()
  ######

  # Generalization Error estimated by cross-validation:
  leukemiasClassifier@generalizationError
genesDetails-methods

Details of the genes in the network.

Description
Information of the genes in the ranking (table format).

Arguments

object 

A GenesRanking

nGenes
integer. Number of genes to show per class

numDecimals
integer. Number of decimals to show in the numeric values

classes
character. Classes of the genes to show

genes
character. Genes to show

Value
A list containing a dataframe with the details of the genes of each class. For each gene, the following information is provided:

ranking
Ranking of the gene.

gERankMean
Mean rank the gene obtained in the cross-validation loops. Only available if geNetClassifier() was called with option estimateGError=TRUE (False by default).

class
Class the gene was chosen for (the class the gene differentiates from the other classes).

postProb
Posterior probability which the gene was assigned by the expectation-maximization algorithm (emfit). Tied values are ranked based on the higher absolute value of exprsMeanDiff. Values are rounded. Several genes may look tied at posterior probability '1' but may actually be i.e. 0.999998 and 0.999997.

exprsMeanDiff
Difference between the mean expression of the gene within its class and its mean expression in the other classes.

exprsUpDw
Gene repressed (DOWN) or over-expressed (UP) for the current class (compared to the other classes).

discriminantPower
Measure calculated based on the coordinates of the support vectors. Represents the weight that the classifier gives to each gene to separate the classes.

discrPwClass
Class for which the Discriminant Power was calculated for.

isRedundant
Does the gene have a high correlation or mutual information with other genes in the list? The threshold to consider a gene redundant can be set through the arguments (by default: correlationsThreshold=0.8 and interactionsThreshold=0.5).
Methods
genesDetails(object, nGenes=NULL, numDecimals=4, classes=NULL, genes=NULL)

GenesNetwork-class  Class "GenesNetwork"

Description
Contains the network returned by geNetClassifier. (Slot: @genesNetwork)

Methods
getNodes  signature(object = "GenesNetwork"): Returns the network nodes (genes).
getEdges  signature(object = "GenesNetwork"): Returns the network edges (relationships).
getNumNodes signature(object = "GenesNetwork"): Returns the number of nodes (genes) in
the network.
getNumEdges signature(object = "GenesNetwork"): Returns the number of edges (relationships)
in the network.
getSubNetwork signature(network = "GenesNetwork"): Returns a new network containing
only the given genes.
network2txt  signature(network = "GenesNetwork"): Exports the network as text file.

# Plot the network of the class "ALL"
plotNetwork(subNet$ALL, genesInfo=clGenesInfo,
plotOnlyConnectedNodesNetwork=FALSE)
```
Description

Contains a genes ranking and the genes info calculated by \texttt{geNetClassifier}.
(Slots @classificationGenes and @genesRanking from \texttt{geNetClassifier} output)

Methods

genesDetails signature(object = "GenesRanking"): Returns data.frames with information about the genes.

getRanking signature(object = "GenesRanking"): Returns a matrix containing the ranked genes.

getTopRanking signature(object = "GenesRanking", numGenesClass): Returns a new Genes-Ranking object containing only the top genes of each class.

gClasses signature(object = "GenesRanking"): Returns the classes for which the genes are ranked.

numGenes signature(object = "GenesRanking"): Returns the number of available ranked genes per class.

numSignificantGenes signature(object = "GenesRanking"): Returns the number of significant genes per class (genes over the given posterior probability threshold).

plot signature(x = "GenesRanking", y = "missing"): Plots the genes’ posterior probability. Wrapper of \texttt{calculateGenesRanking}.

########
# Creating a GenesRanking object
# i.e. To use geNetClassifier() with a ranking based on another algorithm

### 1. Calculate gene scores
# Two classes:
geneScore <- matrix(sample(seq(0,1,by=0.01), size=100, replace=TRUE))
colnames(geneScore) <- "BothClasses"
rownames(geneScore) <- paste("Gene", 1:100, sep="")

# More than two classes:
geneScore <- matrix(sample(seq(0,1,by=0.01), size=300, replace=TRUE), ncol=3)
colnames(geneScore) <- paste("Class", 1:3, sep="")
```
```r
rownames(geneScore) <- paste("Gene", 1:100, sep="")

### 2. Create object
postProb <- geneScore
ord <- apply(postProb, 2, function(x) order(x, decreasing=TRUE))
numGenesClass <- apply(postProb, 2, function(x) sum(!is.na(x)))
customRanking <- new("GenesRanking", postProb=postProb, ord=ord, numGenesClass=numGenesClass)

# GenesRanking object ready:
customRanking
genesDetails(customRanking)
customRanking@numGenesClass
numSignificantGenes(customRanking)

# geNetClassifier(..., precalcGenesRanking = customRanking)
```

---

**geneSymbols**

*Gene symbols associated to human Ensemble IDs.*

---

**Description**

Gene symbols to use as gene labels in the package examples.

**Usage**

```r
data(geneSymbols)
```

**Format**

Named character vector containing the gene symbol as content, and the associated Ensemble ID as name.

**Examples**

```r
data(geneSymbols)
head(geneSymbols)
```
geNetClassifier  

Main function of the geNetClassifier package.  

Trains the multi-class SVM classifier based on the given gene expression data through transparent detection of gene markers and their associated networks.

Description

Allows to train the classifier, calculate the genes network...

Usage

geNetClassifier(eset, sampleLabels, plotsName = NULL, 
buildClassifier = TRUE, estimateGError = FALSE, 
calculateNetwork = TRUE, labelsOrder = NULL, geneLabels = NULL, 
umGenesNetworkPlot = 100, 
minGenesTrain = 1, maxGenesTrain = 100, continueZeroError = FALSE, 
numIters = 6, lpThreshold = 0.95, numDecimals = 3, 
removeCorrelations = FALSE, correlationsThreshold = 0.8, 
correlationMethod = "pearson", 
removeInteractions = FALSE, interactionsThreshold = 0.5, 
minProbAssignCoeff = 1, minDiffAssignCoeff = 0.8, 
IQRfilterPercentage = 0, skipInteractions = TRUE, 
precalcGenesNetwork = NULL, precalcGenesRanking = NULL, 
returnAllGenesRanking = TRUE, kernel="linear", verbose=TRUE, ...)

Arguments

eset  
ExpressionSet or matrix. Gene expression of the train samples (positive & non-logarithmic normalized values).

sampleLabels  
Character. PhenoData variable (column name) containing the train samples class labels.  
Matrix or Factor. Class labels of the train samples.

labelsOrder  
Vector or Factor. Class labels of the train samples.  
Order in which the labels should be shown in the returned results and plots.

plotsName  
Character. File name with which the plots should be saved. If not provided, no plots will be drawn.

buildClassifier  
Logical. If TRUE trains a classifier with the given samples.

estimateGError  
Logical. If TRUE uses cross-validation to estimate the Generalization Error of a classifier trained with the given samples.

calculateNetwork  
Logical. If TRUE calculates the coexpression network between the best genes.

geneLabels  
Vector or Matrix. Gene name, ID or label which should be shown in the returned results and plots.
numGenesNetworkPlot
   Integer. Number of genes to show in the coexpression network for each class.

minGenesTrain
   Integer. Maximum number of genes per class to train the classifier with.

maxGenesTrain
   Integer. Maximum number of genes per class to train the classifier with.

continueZeroError
   Logical. If TRUE, the program will continue testing combinations with more
genesis even if error 0 has been reached.

numIters
   Integer. Number of iterations to determine the optimum number of genes (be-
tween minGenesTrain and maxGenesTrain).

lpThreshold
   Numeric between 0 and 1. Required posterior probability value to consider a
gene 'significant'.

removeCorrelations
   Logical. If TRUE, no correlated genes will be chosen to train the classifier.

correlationsThreshold
   Numeric between 0 and 1. Minimum Pearson’s correlation coefficient to con-
sider genes correlated.

correlationMethod
   "pearson", "kendall" or "spearman". Type of correlation to calculate between
genesis.

removeInteractions
   Logical. If TRUE, genes with Mutual Information coefficient over the threshold
will not be chosen to train the classifier.

interactionsThreshold
   Numeric between 0 and 1. Minimum Mutual Information coefficient to consider
two genes equivalent.

numDecimals
   Integer. Number of decimals to show in the statistics.

minProbAssignCoeff
   Numeric. Allows modifying the required probability to assign a sample to a
class in the internal crossvalidation. For details see: queryGeNetClassifier

minDiffAssignCoeff
   Numeric. Allows modifying the difference of probabilities required between
the most likely class and second most likely class to assign a sample. For details
see: queryGeNetClassifier

IQRfilterPercentage
   Integer. InterQuartile Range (IQR) filter applied to the initial data. Not recom-
mended for more than two classes.

skipInteractions
   Logical. If TRUE, the interactions between genes are not calculated (they will
not appear on the genes network). Saves some execution time. Only available if
removeInteractions=FALSE.

precalcGenesNetwork
   GenesNetwork from a previous execution with the same expression data and
parameters.

precalcGenesRanking
   GenesRanking from a previous execution with the same expression data and
parameters.
returnAllGenesRanking Logical. If TRUE, returns the whole genes ranking. If FALSE the returned ranking contains only the significant genes (genes over lpThreshold).

verbose Logical. If TRUE, messages indicating the execution progress will be shown.

kernel Character. Type of SVM kernel. Default: "linear",

... Other arguments to pass to the svm function.

Value
A GeNetClassifierReturn object containing the classifier and the genes chosen to train it (classificationGenes), Cross-Validation statistics, the whole GenesRanking and each class' GenesNetwork (if requested).
Several plots saved as 'plotsName_....pdf' in the working directory.

Examples

```
########
# Load libraries and training data
########

# Load an expressionSet:
library(leukemiasEset)
data(leukemiasEset)

# Select the train samples:
# summary(leukemiasEset$LeukemiaType[trainSamples])

########
# Training
########

# NOTE: Training the classifier takes a while...
# Choose ONE of the followings, or modify to suit your needs:
## Not run:
# "Basic" execution: All default parameters
leukemiasClassifier <- geNetClassifier(eset=leukemiasEset[,trainSamples],
  sampleLabels="LeukemiaType", plotsName="leukemiasClassifier")

# All default parameters also estimatings the classifier's Generalization Error:
# ( by default: buildClassifier=TRUE, calculateNetwork=TRUE)
# Takes longer time than the basic execution
leukemiasClassifier <- geNetClassifier(eset=leukemiasEset[,trainSamples],
  sampleLabels="LeukemiaType", plotsName="leukemiasClassifier",
  estimateGError=TRUE)

# Faster execution (few minutes - depending on the computer):
# By skipping the calculation of the interactions (MI) betwen the genes,
# and reducing the number of genes to explore when training the classifier
# (100 by default), the execution time can be slightly reduced
leukemiasClassifier <- geNetClassifier(eset=leukemiasEset[,trainSamples],
  sampleLabels="LeukemiaType", plotsName="leukemiasClassifier",
  skipInteractions= TRUE, maxGenesTrain=20)

# To any of these examples, you can add/remove the argument geneLabels,
# in order to show/remove the gene name in the rankings and plots:
```
# The argument labelsOrder allows showing the classes in a specific order
# i.e.: labelsOrder=c("ALL","CLL","AML","CML","NoL")

save(leukemiasClassifier, file="leukemiasClassifier.RData") # Save execution result

?plotExpressionProfiles

## End(Not run)

GeNetClassifierReturn-class

Class "GeNetClassifierReturn"

Description

Object wich wraps all the items returned by geNetClassifier. It usually contains the classifier, the genes ranking and information, the network and any other requested statistics.

Methods

names signature(x = "GeNetClassifierReturn"): Shows the available slots in the object.
overview signature(object = "GeNetClassifierReturn"): Shows an overview of all the slots in the object.
Slots

Available slots depends on the arguments used to call `geNetClassifier()`: 

- **call**: call. Always available.

- **classifier**: list. SVM classifier. Only available if `geNetClassifier()` was called with option `buildClassifier=TRUE` (default settings).

- **classificationGenes**: `GenesRanking`. Genes used to train the classifier. Only available if `geNetClassifier()` was called with option `buildClassifier=TRUE` (default settings).

- **generalizationError**: `GeneralizationError`. Statistics calculated for the current training set and options.
  - Only available if `geNetClassifier()` was called with option `estimateGError=TRUE` (False by default).

- **genesRanking**: `GenesRanking`. Whole genes ranking (if `returnAllGenesRanking=TRUE`) or significant genes ranking (if `returnAllGenesRanking=FALSE`, includes only the genes with posterior probability over `lpThreshold`)

- **genesRankingType**: character. "all", "significant" or "significantNonRedundant"

- **genesNetwork**: List of `GenesNetwork`. Only available if `geNetClassifier()` was called with option `calculateNetwork=TRUE` (default settings).

- **genesNetworkType**: character. At the moment, only "topGenes" available.

Examples

```
# Load data and train a classifier

# Load an expressionSet:
library(leukemiasEset)
data(leukemiasEset)

# Select the train samples:
# summary(leukemiasEset$LeukemiaType[trainSamples])
```
# Train a classifier or load a trained one:
# leukemiasClassifier <- geNetClassifier(leukemiasEset[,trainSamples],
#   sampleLabels="LeukemiaType", plotsName="leukemiasClassifier")
data(leukemiasClassifier) # Sample trained classifier

#######
# Explore the returned object
#######
# Global view of the object and its structure:
leukemiasClassifier
names(leukemiasClassifier)

### Depending on the available slots:
# Call and access to the classifier:
leukemiasClassifier@call
leukemiasClassifier@classifier

# Genes used for training the classifier:
umGenes(leukemiasClassifier@classificationGenes)
leukemiasClassifier@classificationGenes

# Show de details of the genes of a class
genesDetails(leukemiasClassifier@classificationGenes)$AML

# If your R console wraps the table rows, try widening your display width:
# options(width=200)

# Generalization Error estimated by cross-validation:
leukemiasClassifier@generalizationError
overview(leukemiasClassifier@generalizationError)

# i.e. probabilityMatrix:
leukemiasClassifier@generalizationError@probMatrix

# i.e. statistics of the genes chosen in any of the CV loops for for AML:
leukemiasClassifier@generalizationError@classificationGenes.stats$AML

# List of Networks by classes:
leukemiasClassifier@genesNetwork

# Access to the nodes or edges of each network:
getEdges(leukemiasClassifier@genesNetwork$AML)
getNodes(leukemiasClassifier@genesNetwork$AML)

# Genes ranking:
leukemiasClassifier@genesRanking
numGenes(leukemiasClassifier@genesRanking)
numSignificantGenes(leukemiasClassifier@genesRanking)

details of the genes of AML:
genesDetails(leukemiasClassifier@genesRanking)$AML[1:10,]

to get a sub ranking with the top 10 genes:
getTopRanking(leukemiasClassifier@genesRanking, 10)
**getEdges-methods**

*Edges in the network.*

**Description**

Returns the network’s edges (relations between genes).

**Methods**

```r
signature(object = "GenesNetwork")
```

**See Also**

Main package function and classifier training: `geNetClassifier`
This method’s class (`GenesNetwork`) help page.

**Examples**

```r
data(leukemiasClassifier)
getEdges(leukemiasClassifier@genesNetwork$AML)[1:5,]
```

---

**getNodes-methods**

*Nodes in the network.*

**Description**

Returns the network’s nodes (genes).

**Methods**

```r
signature(object = "GenesNetwork")
```

**See Also**

Main package function and classifier training: `geNetClassifier`
This method’s class (`GenesNetwork`) help page.

**Examples**

```r
data(leukemiasClassifier)
getNodes(leukemiasClassifier@genesNetwork$AML)[1:5]
```
getNenEdges-methods

Number of edges in the network.

Description

Returns the number of edges (relationships) in the network.

Methods

signature(object = "GenesNetwork")

See Also

Main package function and classifier training: geNetClassifier
This method’s class (GenesNetwork) help page.

Examples

data(leukemiasClassifier)
getNumEdges(leukemiasClassifier@genesNetwork$AML)

getNenNodes-methods

Number of nodes in the network.

Description

Returns the number of nodes (genes) in the network.

Methods

signature(object = "GenesNetwork")

See Also

Main package function and classifier training: geNetClassifier
This method’s class (GenesNetwork) help page.

Examples

data(leukemiasClassifier)
getNumNodes(leukemiasClassifier@genesNetwork$AML)
getRanking-methods  Shows the genes ranking.

Description

Shows the ranking as matrix: Ranked genes by classes.

Arguments

object a GenesRanking
showGeneID boolean. If TRUE, the genes will be shown with the gene IDs used in the expressionSet. This matrix will be ...$geneID in the returned list.
showGeneLabels boolean. If TRUE, and if the ranking contains gene labels, the ranking matrix will use them. This matrix will be ...$geneLabels in the returned list.

Value

The method returns a list with one or two matrices: ...$geneLabels and ...$geneID.

See Also

Main package function and classifier training: geNetClassifier
This method’s class (GenesRanking) help page.

Examples

data(leukemiasClassifier)
getRanking(leukemiasClassifier@classificationGenes)

# Top 7 genes (two ways):
getRanking(leukemiasClassifier@genesRanking)$geneLabels[1:7,
getRanking(getTopRanking(leukemiasClassifier@genesRanking, 7))

# Show gene ID and select a class:
getRanking(leukemiasClassifier@classificationGenes, showGeneID=TRUE
)$geneID[,"CML", drop=FALSE]

getSubNetwork-methods  Get a sub-network.

Description

Returns the sub-network formed by the given genes.

Usage

getSubNetwork(network, genes, showWarnings=TRUE)
Arguments

- network: GenesNetwork or GenesNetwork list containing the whole network.
- genes: GenesRanking or character vector. Genes in the new network.
- showWarnings: Logical. If true, shows warnings if the given genes are not in the network.

Value

A GenesNetwork or list of networks between the given genes.

See Also

Main package function and classifier training: geNetClassifier
This method’s class (GenesNetwork) help page.

Examples

data(leukemiasClassifier)
clGenesSubNet <- getSubNetwork(leukemiasClassifier@genesNetwork, leukemiasClassifier@classificationGenes)
getSubNetwork(leukemiasClassifier@genesNetwork, getTopRanking(leukemiasClassifier@genesRanking, numGenesClass=30))

getTopRanking-methods  Gets a new ranking with the given top genes.

Description

Returns a new ranking containing only the top genes of each class.

Arguments

- object: a GenesRanking
- numGenesClass: integer. Number of genes per class.

Methods

getTopRanking(object, numGenesClass)

See Also

Main package function and classifier training: geNetClassifier
This method’s class (GenesRanking) help page.

Examples

data(leukemiasClassifier)  # Sample classifier

# Sub-ranking with the top 10 genes:
getTopRanking(leukemiasClassifier@genesRanking, 10)
Description

A sample of the object returned by geNetClassifier. Containins the classifier, the network, and the gene statistics.

Usage

data(leukemiasClassifier)

Format

GeNetClassifierReturn object

Examples

data(leukemiasClassifier)
# Global view of the object and its structure:
leukemiasClassifier
names(leukemiasClassifier)

# Call and acess to the classifier:
leukemiasClassifier@call
leukemiasClassifier@classifier

# Genes used for training the classifier:
numGenes(leukemiasClassifier@classificationGenes)
leukemiasClassifier@classificationGenes
genDetails(leukemiasClassifier@classificationGenes)

# Generalization Error estimated by cross-validation:
# leukemiasClassifier@generalizationError
# overview(leukemiasClassifier@generalizationError)

# List of Networks by classes:
leukemiasClassifier@genesNetwork

# Access to the nodes or edges of each network:
getEdges(leukemiasClassifier@genesNetwork$AML)[1:5,]
getNodes(leukemiasClassifier@genesNetwork$AML)[1:50]

# Global genes ranking:
leukemiasClassifier@genesRanking
numGenes(leukemiasClassifier@genesRanking)
numSignificantGenes(leukemiasClassifier@genesRanking)
# getTopRanking(leukemiasClassifier@genesRanking, 10)
Description

Saves the GenesNetwork as text file.

Usage

network2txt(network, filePrefix = NULL, nwClass = NULL)

Arguments

network GenesNetwork or list of GenesNetworks.
filePrefix Character. File name prefix.
nwClass Character. Network class.

Value

Saves the networks as text (.txt) files. The files will be saved in the current working directory as filePrefix_className.txt.

See Also

Main package function and classifier training: geNetClassifier
This method’s class (GenesNetwork) help page.

Examples

## Load or calculate a network:
data(leukemiasClassifier)

## Export as text:
network2txt(leukemiasClassifier$genesNetwork, filePrefix="leukemiasNetwork")

numGenes-methods Number of genes in the genesRanking.

Description

Provides the number of genes in the genesRanking.

Methods

signature(object = "GenesRanking")
numSignificantGenes-methods

See Also

Main package function and classifier training: geNetClassifier
This method's class (GenesRanking) help page.

Examples

data(leukemiasClassifier)
numGenes(leukemiasClassifier@genesRanking)

numSignificantGenes-methods

Number of ranked genes over the posterior probability threshold.

Description

Provides the number of ranked genes over the posterior probability threshold

Arguments

object a GenesRanking
lpThreshold Posterior probability threshold
numSignificantGenesType "ranked" or "global".
Ranked will show the count of genes on the ranking of each class. Each gene will be counted only once, since it is only kept in the class for which it had better ranking.
Global counts the genes over the threshold before assigning them to a class. i.e. a gene might have 0.3 for one class, and 0.25 for another, if we are taking a threshold of 0.20, it will be counted on both classes.

Methods

numSignificantGenes(object, lpThreshold=0.95, numSignificantGenesType="ranked")

See Also

Main package function and classifier training: geNetClassifier
This method's class (GenesRanking) help page.

Examples

data(leukemiasClassifier)
# Total number of genes in the ranking:
numGenes(leukemiasClassifier@genesRanking)
# Number of genes over the posterior probability threshold
# Default: lpThreshold=0.95, numSignificantGenesType="ranked"
Overview

Description

Provides an overview of all the slots in the object.

Methods

It can be applied to the following classes:

- `signature(object = "GenesNetwork")`
- `signature(object = "GenesRanking")`
- `signature(object = "GeNetClassifierReturn")`
- `signature(object = "GeneralizationError")`

See Also

Main package function and classifier training: `geNetClassifier`
This method's classes help pages:
- `GenesRanking`
- `GenesNetwork`
- `GeNetClassifierReturn`
- `GeneralizationError`

Examples

data(leukemiasClassifier)
# geNetClassifier return:
overview(leukemiasClassifier)
# Generalization Error and stats estimated by cross-validation:
overview(leukemiasClassifier@generalizationError)
# A GenesNetwork:
# (a class has to be selected, otherwise it is a list)
overview(leukemiasClassifier@genesNetwork$ALL)

# For a GenesRanking, we recommend to use genesDetails() instead:
genesDetails(leukemiasClassifier@classificationGenes)$AML
Description

Plots the posterior probability of the genes ordered by class ranking.

Usage

```r
## S3 method for class 'GenesRanking'
plot(x, y="missing", numGenesPlot=1000,
     plotTitle="Significant genes", lpThreshold = 0.95, ...)
```

Arguments

- `x` : GenesRanking.
- `numGenesPlot` : Numeric. Number of genes to plot.
- `plotTitle` : Character. Plot main title.
- `lpThreshold` : Numeric between 0 and 1. Required posterior probability value to consider a gene 'significant'.
- `y` : Not required.
- `...` : Not required

Details

Significant genes: Genes with posterior probability over 'lpThreshold'.
More significant genes may mean:

- Very different class
- More systemic disease

Plot lines represent the posterior probability of genes, sorted by rank from left to right.

In order to find genes that differentiate the classes from each other, the function ranks the genes based on their posterior probability for each class.
The posterior probability represents how well a gene differentiates samples from a class, from samples from other classes. Therefore, Genes with high posterior probability are good to differentiate a class from all the others.
This posterior probability is calculated by `emfit(pkg:EBarrays)`, an expectation-maximization (EM) algorithm for gene expression mixture model.

Value

Posterior probability plot of the top genes.
Examples

# Load or calculate a ranking (or a classifier with geNetClassifier)
data(leukemiasClassifier) # Sample trained classifier, @genesRanking

# Default plot:
plot(leukemiasClassifier@genesRanking)

# Changing options:
plot(leukemiasClassifier@genesRanking,
    numGenesPlot=5000, plotTitle="Leukemias", lpThreshold=0.9)

plot.GeNetClassifierReturn

Plot GeNetClassifierReturn

Description

Allows generating the plots from the objet created by geNetClassifier.

Usage

## S3 method for class 'GeNetClassifierReturn'
plot(x, y="missing", fileName = NULL, lpThreshold = 0.95, 
    numGenesLpPlot = 1000, numGenesNetworkPlot = 100, 
    geneLabels = NULL, verbose = TRUE, ...)

Arguments

x          GeNetClassifierReturn. Object returned by the main function "geNetClassifier".
fileName   Character. File name to save the plots.
lpThreshold Numeric between 0 and 1. Required posterior probability value to consider a
gene 'significant'.
numGenesLpPlot Integer. Number of genes to show in the significant genes plot.
numGenesNetworkPlot Integer. Number of genes (nodes) to plot in the network.
geneLabels Vector or Matrix. Gene name, ID or label which should be shown in the returned
results and plots.
verbose Logical. If TRUE, messages indicating the execution progress will be printed
on screen.
y          Not required.
...        Not required

Details

The plots are generated by default by geNetClassifier. This function allows re-plotting them
with different parameters.
**plotAssignments**

**Value**

Plots (depending on the available info):
- Significant genes
- Classification genes’ Discriminant Power
- Top ranked genes network (for each class)

**See Also**

Main package function and classifier training: `geNetClassifier`

Class `GeNetClassifierReturn`

Other plotting functions:
- `plotDiscriminantPower`
- `plot.GenesRanking`
- `plotNetwork`

**Examples**

```r
# Train or load an already trained classifier
data(leukemiasClassifier)

# Plot default plots on-screen
plot(leukemiasClassifier)

# Save plots on file
# (includes Discriminant Power of all genes, but the networks will not be interactive)
plot(leukemiasClassifier, fileName="newPlots")
```

---

**plotAssignments**  
*Plot assignment probabilities*

**Description**

Plots the assignment probabilities of a previous query.

**Usage**

```r
plotAssignments(queryResult, realLabels,  
minProbAssignCoeff = 1, minDiffAssignCoeff = 0.8,  
totalNumberOfClasses = NULL, pointSize=0.8, identify = FALSE)
```
Arguments

queryResult Object returned by `queryGeNetClassifier`
realLabels Factor. Actual/real class of the samples.
minProbAssignCoeff Numeric. See `queryGeNetClassifier` for details.
minDiffAssignCoeff Numeric. See `queryGeNetClassifier` for details.
totalNumberOfClasses Numeric. Total number of classes the classifier was trained with. The assignment probability is determined based on it. It is not needed if there are samples of all the training classes.
pointSize Numeric. Point size modifier.
identify Logical. If TRUE and supported (X11 or quartz devices), the plot will be interactive and clicking on a point will identify the sample the point represents. Press ESC or right-click on the plot screen to exit.

Value

Plot.

See Also

Main package function and classifier training: `geNetClassifier`
Querying the classifier: `queryGeNetClassifier`

Examples

```
# Classifier training
# Load an expressionSet:
library(leukemiasEset)
data(leukemiasEset)

# Select the train samples:
trainSamples< c(1:10, 13:22, 25:34, 37:46, 49:58)
# summary(leukemiasEset$LeukemiaType[trainSamples])

# Train a classifier or load a trained one:
# leukemiasClassifier <- geNetClassifier(leukemiasEset[,trainSamples],
#   sampleLabels="LeukemiaType", plotsName="leukemiasClassifier")
data(leukemiasClassifier) # Sample trained classifier

# External Validation:
# Select the samples to query the classifier
```
# - External validation: samples not used for training
testSamples <- c(1:60)[-trainSamples]

# Make a query to the classifier:
queryResult <- queryGeNetClassifier(leukemiasClassifier, leukemiasEset[,testSamples])

#####################
## Plot:
#####################
plotAssignments(queryResult, realLabels=leukemiasEset[,testSamples]$LeukemiaType)

---

**plotDiscriminantPower**  
*Plots the genes’ Discriminant Power.*

**Description**

Calculates and plots the Discriminant Power of the genes in the given classifier.

**Usage**

```r
plotDiscriminantPower(classifier, classificationGenes = NULL,  
geneLabels = NULL, classNames = NULL, plotDP = TRUE,  
fileName = NULL, returnTable = FALSE, verbose = TRUE)
```

**Arguments**

- `classifier`: Classifier returned by `geNetClassifier`. (`@classifier`)
- `classificationGenes`: Vector or Matrix. IDs of the genes to plot.  
  If matrix: genes should be ordered by classes. Columns should be named after  
  the classes.
- `geneLabels`: Vector or Matrix. Gene name, ID or label which should be shown in the returned  
  results and plots.
- `classNames`: Named vector. Short version of the class names if different from the ones used  
  to train the classifier.
- `plotDP`: Logical. If TRUE, plots the discriminant power of the given genes.
- `fileName`: Character. File name to save the plot with. If not provided, the plots will be  
  shown through the standard output device.
- `returnTable`: Logical. If TRUE, returns a table with the genes discriminant power.
- `verbose`: Logical. If TRUE, messages indicating the execution progress will be printed  
  on screen.

**Details**

The Discriminant Power represents the weight the (SVM) classifier gives each gene to separate  
the classes. It is calculated based on the coordinates of the support vectors. Genes with a high  
Discriminant Power are better for identifying samples from the class.
plotDiscriminantPower

Value

- Data frame Optional. Data.frame containing the genes and their Discriminant Power.
- Discriminant Power plot Optional. Shown through the standard output device or saved in the working directory as 'fileName.pdf' if fileName was provided.

# sampleLabels="LeukemiaType", plotsName="leukemiasClassifier")
data(leukemiasClassifier) # Sample trained classifier

#####
# Discriminant Power
#####
# Default (plots up to 20 genes)
plotDiscriminantPower(leukemiasClassifier)
# Plot a specific gene:
plotDiscriminantPower(leukemiasClassifier, classificationGenes="ENSG00000169575")
# Plot top5 genes of a class, and return their discriminant power:
# Note: The discriminant Power can only be calculated for 'classificationGenes'
# (genes chosen for training the classifier)
genes <- getRanking(leukemiasClassifier@classificationGenes,
    showGeneID=TRUE)$geneID[1:5,"AML",drop=FALSE] # Top 5 genes of AML
discPowerTable2 <- plotDiscriminantPower(leukemiasClassifier,
classificationGenes=genes, returnTable=TRUE)

# For plotting more than 20 genes or saving the plots as .pdf, provide a fileName
plotDiscriminantPower(leukemiasClassifier,
    fileName="leukemiasClassifier_DiscriminantPower.pdf")
```
plotExpressionProfiles

Expression profiles plot.

Description

Plots the expression profiles of the given genes.

Usage

plotExpressionProfiles(eset, genes=NULL, fileName=NULL, geneLabels=NULL, type="lines", sampleLabels=NULL, sampleColors=NULL, labelsOrder=NULL, classColors=NULL, sameScale=TRUE, showSampleNames=FALSE, showMean=FALSE, identify=TRUE, verbose=TRUE)

Arguments

eset
ExpressionSet or Matrix. Gene expression of the samples.

genes
Vector or Matrix. IDs of the genes to plot. If matrix: genes should be ordered by classes. Columns should be named after the classes. If not provided, all available genes will be plot. Warning: If a list of genes is not provided, it will plot all available genes.

fileName
Character. File name to save the plots. If not provided, up to 20 genes will be shown on screen.

geneLabels
Vector or Matrix. Gene name, ID or label which should be shown in the returned results and plots.

type
Character. Plot type: "lines" or "boxplot".

sampleLabels
Character. PhenoData variable (column name) containing the train samples class labels. Matrix or Factor. Class labels of the train samples.

sampleColors
Character. Colors for the lines of the samples.

labelsOrder
Vector or Factor. Order in which the labels should be shown in the returned results and plots.

classColors
Character. Colors for each of the classes or samples of the class. Provide either sampleColors or classColors, not both.

sameScale
Logical. If TRUE, plots all the genes in the same expression scale.

showSampleNames
Logical. If TRUE, the sample names are shown in the plot. Not recommended for big datasets.

showMean
Logical. If TRUE, plots the class expression mean.

identify
Logical. If TRUE and supported (X11 or quartz devices), the plot will be interactive and clicking on a point will identify the sample the point represents. Press ESC or right-click on the plot screen to exit.

verbose
Logical. If TRUE, a message indicating where the pdf is saved will be printed on screen.
Value

The expression profiles plot, saved in the working directory as `fileName.pdf`.

Author(s)

Examples

```

```
# Plot expression of all the genes of specific classes:
classGenes <- getRanking(leukemiasClassifier@classificationGenes,
    showGeneID=TRUE)$geneID[,c("CLL"), drop=FALSE]  # Feel free to modify
plotExpressionProfiles(leukemiasEset, genes=classGenes, sampleLabels="LeukemiaType",
    type="boxplot")

# Plot (on screen) the expression of the top ranked genes of each class
plotExpressionProfiles(leukemiasEset, leukemiasClassifier, sampleLabels="LeukemiaType")

---

plotNetwork  

**Plot GenesNetwork**

### Description

Plots the coexpression and/or mutual information network for the given genes.

### Usage

```
plotNetwork(genesNetwork, classificationGenes=NULL, genesRanking=NULL, 
genesisInfo=NULL, geneLabels=NULL, returniGraphs=FALSE, 
plotType="dynamic", fileName=NULL, 
plotAllNodesNetwork=TRUE, plotOnlyConnectedNodesNetwork=FALSE, 
plotClassificationGenesNetwork=FALSE, 
labelSize=0.5, vertexSize=NULL, width=NULL, height=NULL, verbose=TRUE)
```

### Arguments

- **genesNetwork**: List of GenesNetwork returned by `geNetClassifier`. (\@genesNetwork)
- **classificationGenes**: Matrix or classificationGenes returned by `geNetClassifier`. (\@classificationGenes)
- **genesRanking**: Matrix or genesRanking returned by `geNetClassifier`. (\@genesRanking)
- **genesInfo**: List or data.frame with the properties of the genes to plot: genesDetails(@genesRanking)
- **geneLabels**: Vector or Matrix. Gene name, ID or label which should be shown in the returned results and plots.
- **returniGraphs**: deprecated. A list with the plotted networks as igraph objects is always returned (see `invisible`), assign it to a variable if needed.
- **plotType**: Character. "dynamic": Interactive plot. "static": One canvas split for the different networks. "pdf": All the networks are saved into a pdf file.
- **fileName**: Character. File name to save the plot with. If not provided, the plots will be shown through the standard output device.
- **plotAllNodesNetwork**: Logical. If TRUE, plots a network only with all the available genes
- **plotOnlyConnectedNodesNetwork**: Logical. If TRUE, plots a network only with the connected nodes/genes
plotClassificationGenesNetwork

Logical. If TRUE, plots a network only with the classification genes

labelSize

Integer. Gene/node label size for static and pdf plots.

vertexSize

Integer. Vertex minimum size.

width

Numeric. Dinamic or pdf plot width.

height

Numeric. Dinamic or pdf plot height.

verbose

Logical. If TRUE, messages indicating the execution progress will be shown.

Value

Graph list
List with the plotted igraph objects.

Network plots
Shown through the standard output device or saved in the working directory as 'fileName.pdf' if fileName was provided.

Author(s)

References

Package igraph

See Also

plot.GenesNetwork() is an alias to this function. It can also be called as i.e. plotNetwork(clGenesSubNet$ALL)

Note: The slot @genesNetwork returned by geNetClassifier is a List of GenesNetworks!

Examples

data(leukemiasClassifier)

# Step 1: Select a network or sub network
# Sub-network containing only the classification genes:
clGenesSubNet <- getSubNetwork(leukemiasClassifier@genesNetwork,
    leukemiasClassifier@classificationGenes)

# Step 2: Select the details/info about the genes to plot
# Classification genes' info:
clGenesInfo <- genesDetails(leukemiasClassifier@classificationGenes)

# Step 3: Plot the network
# Network plots can be interactive or plotted as PDF file.
# - - Use plotType="pdf" to save the network as a static pdf file.
#     This option is recommended for getting an overview of several networks.
# - - To get an interactive network, just skip this argument.

# Plot ALL network:
queryGeNetClassifier  Queries the classifier trained with geNetClassifier.

Description
Queries the classifier trained by geNetClassifier in order to find out the class of new samples.

Usage
queryGeNetClassifier(classifier, eset, minProbAssignCoeff = 1,
                      minDiffAssignCoeff = 0.8, verbose = TRUE)

Arguments
classifier  Classifier returned by geNetClassifier. (@classifier)
eset        ExpressionSet or Matrix. Gene expression matrix of the new samples.
minProbAssignCoeff
            Numeric. Coefficient to modify the minimum probability required to assign a
            sample to a class. Reduce to improve call rate. Increase to reduce error. 0:
            Removes this restriction. The sample will always be assigned to the class with
            the highest probability. between 0 and 1: Reduces the required probability to
            assign a sample to a class. >1: Increases the required probability. Warning: if
            minProbCoef is equal to 2*number of classes, all the samples will be left as
            'NotAssigned'.
minDiffAssignCoeff
            Numeric. Coefficient to modify the required difference between the two most
            likely classes. Reduce to improve call rate. Increase to reduce error. 0: Re-
           moves this restriction. The probability of the second most-likely class will not be
            taken into account. between 1 and 1: Reduces the required difference to assign
queryGeNetClassifier

the sample. >1: Increases the required difference. Warning: if minDiffAssignCoeff is equal to the number of classes, all the samples will be left as 'NotAssigned'.

verbose Logical. If TRUE, messages indicating the execution progress will be printed on screen.

Details

By default, in order to assign a sample two conditions must be met:

- if minProbAssignCoeff = 1 The probability of belonging to the class should be at least double of the random probability.
- if minDiffAssignCoeff = 0.8 The difference of probabilities between the most likely class and the second most likely class should be more than 80

This means, that in a 4-class classifier, in order to assing a sample, the highest probability should be at least 0.5 (2x0.25), and the next most-likely-class should have a probability at least 0.2 (80 If these conditions are not met, the sample will be left as notAssigned.

Modify the arguments values in order to modify these assignment conditions. Setting minProbAssignCoeff = 0 and minDiffAssignCoeff = 0 all samples will be assigned to the most likely class without any further restrictions.

Value

List:

- call Command used to execute the function.
- classes Classes to which each of the samples were assigned to.
- probabilities Probabilities to the 2 classes each sample is most likely to belong to.

Examples

##########################
## Classifier training
##########################

# Load an expressionSet:
library(leukemiasEset)
data(leukemiasEset)
# Select the train samples:
# There should be the same number of samples from each class.
# summary(leukemiasEset$LeukemiaType[trainSamples])

# Train a classifier or load a trained one:
leukemiasClassifier <- geNetClassifier(leukemiasEset[,trainSamples],
    sampleLabels="LeukemiaType", plotsName="leukemiasClassifier")
data(leukemiasClassifier)  # Sample trained classifier

##########################
## Classifier Query
##########################
# Select the samples to query the classifier
# - Real use: samples whose class we want to known
querySamples <- "GSM330154.CEL"
# - External validation: samples not used for training
querySamples <- c(1:60)[-trainSamples]

### Make a query to the classifier ("ask" about what class the new samples are):
queryResult <- queryGeNetClassifier(leukemiasClassifier, leukemiasEset[,querySamples])

# See the class it assigned to each sample:
queryResult$class[1:5]
# Or the samples which it wasn't sure about:
t(queryResult$probabilities[,queryResult$class=="NotAssigned"])

# Obtain an overview of the results
querySummary(queryResult)

### Optional: Modify assignment conditions
# (minDiffCoeff=0, minProbCoeff=0: All samples will be assigned to the most likely class)
queryResult_AssignAll <- queryGeNetClassifier(leukemiasClassifier, leukemiasEset[,querySamples],
    minDiffAssignCoeff=0, minProbAssignCoeff=0)
# No samples are left as "NotAssigned":
queryResult$probabilities[,queryResult_AssignAll$class=="Not Assigned"]

### External validation:
# Confusion matrix:
confMatrix <- table(leukemiasEset[,querySamples]$LeukemiaType,
    queryResult_AssignAll$class)
# New accuracy, call rate, sensitivity and specificity:
externalValidation.stats(confMatrix)
# Probability matrix for the assigned samples
externalValidation.probMatrix(queryResult, leukemiasEset[,querySamples]$LeukemiaType)

---

**querySummary**  
Summary of the query.
Description
Counts the number of samples assigned to each class and calculates basic statistics regarding the assignment probabilities.

Usage
querySummary(queryResult, showNotAssignedSamples = TRUE, numDecimals = 2, verbose = TRUE)

Arguments
queryResult Object returned by queryGeNetClassifier
showNotAssignedSamples Logical. Shows the two most likely classes for the NotAssigned samples and the probabilities of belonging to each of them.
numDecimals Integer. Number of decimals to show on the statistics.
verbose Logical. If TRUE, messages indicating the execution progress will be printed on screen.

Value
Returns a list with the following fields:
• callRate Count and percentage of assigned samples.
• assigned Number of samples assigned to each class and mean and SD of the assignment probabilities.
• notAssignedSamples Optional. Most likely classes for the Not Assigned samples.
