Package ‘metagenomeSeq’

December 26, 2018

Title Statistical analysis for sparse high-throughput sequencing

Version 1.24.0

Date 2016-07-21

Author Joseph Nathaniel Paulson, Nathan D. Olson, Justin Wagner, Hisham Talukder, Mi-hai Pop, Hector Corrada

Bravo

Maintainer Joseph N. Paulson <jpaulson@jimmy.harvard.edu>

Description metagenomeSeq is designed to determine features (be it Operational Taxonomic Unit (OTU), species, etc.) that are differentially abundant between two or more groups of multiple samples. metagenomeSeq is designed to address the effects of both normalization and under-sampling of microbial communities on disease association detection and the testing of feature correlations.

metagenomeSeq-package

**Statistical analysis for sparse high-throughput sequencing**

**Description**

metagenomeSeq is designed to determine features (be it Operational Taxonomic Unit (OTU), species, etc.) that are differentially abundant between two or more groups of multiple samples. metagenomeSeq is designed to address the effects of both normalization and under-sampling of microbial communities on disease association detection and the testing of feature correlations.

A user’s guide is available, and can be opened by typing `vignette("metagenomeSeq")`

The metagenomeSeq package implements novel normalization and statistical methodology in the following papers.

**Author(s)**

Paulson, JN <jpaulson@umiacs.umd.edu>; Pop, M; Corrada Bravo, H
aggregateBySample

Aggregates a MRexperiment object or counts matrix to by a factor.

Description

Using the phenoData information in the MRexperiment, calling aggregateBySample on a MRexperiment and a particular phenoData column (i.e. 'diet') will aggregate counts using the aggfun function (default rowMeans). Possible aggfun alternatives include rowMeans and rowMedians.

Usage

aggregateBySample(obj, fct, aggfun = rowMeans, out = "MRexperiment")

aggSamp(obj, fct, aggfun = rowMeans, out = "MRexperiment")

Arguments

obj A MRexperiment object or count matrix.
fct phenoData column name from the MRexperiment object or if count matrix object a vector of labels.
aggfun Aggregation function.
out Either 'MRexperiment' or 'matrix'

Value

An aggregated count matrix or MRexperiment object where the new pData is a vector of 'fct' levels.

Examples

data(mouseData)
aggregateBySample(mouseData[1:100,],fct="diet",aggfun=rowSums)
# not run
# aggregateBySample(mouseData,fct="diet",aggfun=matrixStats::rowMedians)
# aggSamp(mouseData,fct='diet',aggfun=rowMaxs)
aggregateByTaxonomy

Aggregates a MRexperiment object or counts matrix to a particular level.

Description

Using the featureData information in the MRexperiment, calling aggregateByTaxonomy on a MRexperiment and a particular featureData column (i.e. `genus`) will aggregate counts to the desired level using the aggfun function (default colSums). Possible aggfun alternatives include colMeans and colMedians.

Usage

\[
\text{aggregateByTaxonomy}(\text{obj}, \text{lvl}, \text{alternate} = \text{FALSE}, \text{norm} = \text{FALSE}, \\
\text{log} = \text{FALSE}, \text{aggfun} = \text{colSums}, \text{sl} = 1000, \text{featureOrder} = \text{NULL}, \\
\text{returnFullHierarchy} = \text{TRUE}, \text{out} = \text{"MRexperiment"})
\]

\[
\text{aggTax}(\text{obj}, \text{lvl}, \text{alternate} = \text{FALSE}, \text{norm} = \text{FALSE}, \text{log} = \text{FALSE}, \\
\text{aggfun} = \text{colSums}, \text{sl} = 1000, \text{featureOrder} = \text{NULL}, \\
\text{returnFullHierarchy} = \text{TRUE}, \text{out} = \text{"MRexperiment"})
\]

Arguments

- **obj**: A MRexperiment object or count matrix.
- **lvl**: featureData column name from the MRexperiment object or if count matrix object a vector of labels.
- **alternate**: Use the rowname for undefined OTUs instead of aggregating to ”no_match”.
- **norm**: Whether to aggregate normalized counts or not.
- **log**: Whether or not to log2 transform the counts - if MRexperiment object.
- **aggfun**: Aggregation function.
- **sl**: scaling value, default is 1000.
- **featureOrder**: Hierarchy of levels in taxonomy as fData colnames
- **returnFullHierarchy**: Boolean value to indicate return single column of fData or all columns of hierarchy
- **out**: Either ’MRexperiment’ or ’matrix’

Value

An aggregated count matrix.

Examples

\[
\text{data(mouseData)}
\]

\[
\text{aggregateByTaxonomy(mouseData[1:100,],lvl="class",norm=TRUE,aggfun=colSums)}
\]

# not run

# aggregateByTaxonomy(mouseData,lvl="class",norm=TRUE,aggfun=colMedians)

# aggTax(mouseData,lvl="phylum",norm=FALSE,aggfun=colSums)
biom2MRexperiment  

**Biom to MRexperiment objects**

**Description**

Wrapper to convert biom files to MRexperiment objects.

**Usage**

biom2MRexperiment(obj)

**Arguments**

- obj: The biom object file.

**Value**

A MRexperiment object.

**See Also**

loadMeta, loadPhenoData, newMRexperiment, loadBiom

**Examples**

```r
library(biomformat)
rich_dense_file = system.file("extdata", "rich_dense_otu_table.biom", package = "biomformat")
x = biomformat::read_biom(rich_dense_file)
biom2MRexperiment(x)
```

calcNormFactors  

**Cumulative sum scaling (css) normalization factors**

**Description**

Return a vector of the sum up to and including a quantile.

**Usage**

calcNormFactors(obj, p = cumNormStatFast(obj))

**Arguments**

- obj: An MRexperiment object or matrix.
- p: The pth quantile.

**Value**

Vector of the sum up to and including a sample’s pth quantile.
calcPosComponent

**See Also**

`fitZig` `cumNormStatFast` `cumNorm`

**Examples**

```r
data(mouseData)
head(calcNormFactors(mouseData))
```

calcPosComponent  

**Description**

Fit the positive (log-normal) component

**Usage**

```r
calcPosComponent(mat, mod, weights)
```

**Arguments**

- `mat`: A matrix of normalized counts
- `mod`: A model matrix
- `weights`: Weight matrix for samples and counts

**See Also**

`fitZeroLogNormal` `fitFeatureModel`

calcShrinkParameters  

**Description**

Calculate the shrunken variances and variance of parameters of interest across features.

**Usage**

```r
calcShrinkParameters(fit, coef, mins2, exclude = NULL)
```

**Arguments**

- `fit`: A matrix of fits as outputted by `calcZeroComponent` or `calcPosComponent`
- `coef`: Coefficient of interest
- `mins2`: minimum variance estimate
- `exclude`: Vector of features to exclude when shrinking

**See Also**

`fitZeroLogNormal` `fitFeatureModel`
calculateEffectiveSamples

**Description**

Calculates the number of estimated effective samples per feature from the output of a fitZig run. The estimated effective samples per feature is calculated as the sum_1^n (n = number of samples) 1-z_i where z_i is the posterior probability a feature belongs to the technical distribution.

**Usage**

`calculateEffectiveSamples(obj)`

**Arguments**

- **obj**: The output of fitZig run on a MRexperiment object.

**Value**

A list of the estimated effective samples per feature.

**See Also**

`fitZig` `MRcoefs` `MRfulltable`

calcStandardError  *Calculate the zero-inflated log-normal statistic's standard error*

**Description**

Calculat the se for the model. Code modified from "Adjusting for covariates in zero-inflated gamma and zero-inflated log-normal models for semicontinuous data", ED Mills

**Usage**

`calcStandardError(mod, fitln, fitzero, coef = 2, exclude = NULL)`

**Arguments**

- **mod**: The zero component model matrix
- **fitln**: A matrix with parameters from the log-normal fit
- **fitzero**: A matrix with parameters from the logistic fit
- **coef**: Coefficient of interest
- **exclude**: List of features to exclude

**See Also**

`fitZeroLogNormal` `fitFeatureModel`
calcZeroAdjustment

Calculate the zero-inflated component’s adjustment factor

Description
Calculate the log ratio of average marginal probabilities for each sample having a positive count. This becomes the adjustment factor for the log fold change.

Usage
calcZeroAdjustment(fitln, fitzero, mod, coef, exclude = NULL)

Arguments
- fitln: A matrix with parameters from the log-normal fit
- fitzero: A matrix with parameters from the logistic fit
- mod: The zero component model matrix
- coef: Coefficient of interest
- exclude: List of features to exclude

See Also
fitZeroLogNormal, fitFeatureModel

calcZeroComponent

Zero component

Description
Fit the zero (logisitic) component

Usage
calcZeroComponent(mat, mod, weights)

Arguments
- mat: A matrix of normalized counts
- mod: A model matrix
- weights: Weight matrix for samples and counts

See Also
fitZeroLogNormal, fitFeatureModel
correctIndices

*Calculate the correct indices for the output of correlationTest*

**Description**

Consider the upper triangular portion of a matrix of size nxn. Results from the `correlationTest` are output as the combination of two vectors, correlation statistic and p-values. The order of the output is 1vs2, 1vs3, 1vs4, etc. The `correctIndices` returns the correct indices to fill a correlation matrix or correlation-pvalue matrix.

**Usage**

```r
correctIndices(n)
```

**Arguments**

- `n` The number of features compared by `correlationTest` (nrow(mat)).

**Value**

A vector of the indices for an upper triangular matrix.

**See Also**

`correlationTest`

**Examples**

```r
data(mouseData)
mat = MRcounts(mouseData)[55:60,]
cors = correlationTest(mat)
ind = correctIndices(nrow(mat))

cormat = as.matrix(dist(mat))
cormat[cormat>0] = 0
cormat[upper.tri(cormat)][ind] = cors[,1]
table(cormat[1,-1] - cors[1:5,1])
```

---

correlationTest

*Correlation of each row of a matrix or MRexperiment object*

**Description**

Calculates the (pairwise) correlation statistics and associated p-values of a matrix or the correlation of each row with a vector.
correlationTest

Usage

correlationTest(obj, y = NULL, method = "pearson",
    alternative = "two.sided", norm = TRUE, log = TRUE, cores = 1,
    override = FALSE, ...)

Arguments

obj A MRexperiment object or count matrix.
y Vector of length ncol(obj) to compare to.
method One of 'pearson','spearman', or 'kendall'.
alternative Indicates the alternative hypothesis and must be one of 'two.sided', 'greater'
    (positive) or 'less'(negative). You can specify just the initial letter.
norm Whether to aggregate normalized counts or not - if MRexperiment object.
log Whether or not to log2 transform the counts - if MRexperiment object.
cores Number of cores to use.
override If the number of rows to test is over a thousand the test will not commence
    (unless override==TRUE).
... Extra parameters for mclapply.

Value

A matrix of size choose(number of rows, 2) by 2. The first column corresponds to the correlation
value. The second column the p-value.

See Also

correctIndices

Examples

# Pairwise correlation of raw counts
data(mouseData)
cors = correlationTest(mouseData[1:10,],norm=FALSE,log=FALSE)
head(cors)

mat = MRcounts(mouseData)[1:10,]
cormat = as.matrix(dist(mat)) # Creating a matrix
cormat[cormat>0] = 0 # Creating an empty matrix
ind = correctIndices(nrow(mat))
cormat[upper.tri(cormat)][ind] = cors[,1]
table(cormat[1,-1] - cors[1:9,1])

# Correlation of raw counts with a vector (library size in this case)
data(mouseData)
cors = correlationTest(mouseData[1:10,],libSize(mouseData),norm=FALSE,log=FALSE)
head(cors)
cumNorm

Cumulative sum scaling normalization

Description
Calculates each column’s quantile and calculates the sum up to and including that quantile.

Usage
cumNorm(obj, p = cumNormStatFast(obj))

Arguments
obj An MRexperiment object.
p The pth quantile.

Value
Object with the normalization factors stored as a vector of the sum up to and including a sample’s pth quantile.

See Also
fitZig cumNormStat

Examples
data(mouseData)
cumNorm(mouseData)
head(normFactors(mouseData))

cumNormMat

Cumulative sum scaling factors.

Description
Calculates each column’s quantile and calculates the sum up to and including that quantile.

Usage
cumNormMat(obj, p = cumNormStatFast(obj), sl = 1000)

Arguments
obj A matrix or MRexperiment object.
p The pth quantile.
sl The value to scale by (default=1000).
**cumNormStat**

*Value*

Returns a matrix normalized by scaling counts up to and including the pth quantile.

*See Also*

fitZig cumNorm

*Examples*

```r
data(mouseData)
head(cumNormMat(mouseData))
```

---

**cumNormStat**  
*Cumulative sum scaling percentile selection*

*Description*

Calculates the percentile for which to sum counts up to and scale by. `cumNormStat` might be deprecated one day. Deviates from methods in Nature Methods paper by making use row means for generating reference.

*Usage*

```r
cumNormStat(obj, qFlag = TRUE, pFlag = FALSE, rel = 0.1, ...)
```

*Arguments*

- `obj`: A matrix or MRexperiment object.
- `qFlag`: Flag to either calculate the proper percentile using R’s step-wise quantile function or approximate function.
- `pFlag`: Plot the relative difference of the median deviance from the reference.
- `rel`: Cutoff for the relative difference from one median difference from the reference to the next
- `...`: Applicable if `pFlag == TRUE`. Additional plotting parameters.

*Value*

Percentile for which to scale data

*See Also*

fitZig cumNorm cumNormStatFast

*Examples*

```r
data(mouseData)
p = round(cumNormStat(mouseData,pFlag=FALSE),digits=2)
```
**cumNormStatFast**  
*Cumulative sum scaling percentile selection*

**Description**
Calculates the percentile for which to sum counts up to and scale by. Faster version than available in `cumNormStat`. Deviates from methods described in Nature Methods by making use of ro means for reference.

**Usage**
cumNormStatFast(obj, pFlag = FALSE, rel = 0.1, ...)

**Arguments**
- **obj**: A matrix or MRexperiment object.
- **pFlag**: Plot the median difference quantiles.
- **rel**: Cutoff for the relative difference from one median difference from the reference to the next.
- **...**: Applicable if pFlag == TRUE. Additional plotting parameters.

**Value**
Percentile for which to scale data

**See Also**
- `fitZig`
- `cumNorm`
- `cumNormStat`

**Examples**
```r
data(mouseData)
p = round(cumNormStatFast(mouseData, pFlag=FALSE), digits=2)
```

---

**doCountMStep**  
*Compute the Maximization step calculation for features still active.*

**Description**
Maximization step is solved by weighted least squares. The function also computes counts residuals.

**Usage**
doCountMStep(z, y, mmCount, stillActive, fit2 = NULL, dfMethod = "modified")
Arguments

**z**
Matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0).

**y**
Matrix (m x n) of count observations.

**mmCount**
Model matrix for the count distribution.

**stillActive**
Boolean vector of size M, indicating whether a feature converged or not.

**fit2**
Previous fit of the count model.

**dfMethod**
Either ‘default’ or ‘modified’ (by responsibilities)

Details

Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership $\delta_{ij} = 1$ if $y_{ij}$ is generated from the zero point mass as latent indicator variables. The density is defined as $f_{zig}(y_{ij} = \pi_j(S_j) * f_0(y_{ij}) + (1-\pi_j(S_j)) * f_{count}(y_{ij};\mu_i,\sigma_i^2)$. The log-likelihood in this extended model is $\log(f_{count}(y_{ij};\mu_i,\sigma_i^2) + \delta_{ij} \log \pi_j(S_j))$. The responsibilities are defined as $z_{ij} = pr(\delta_{ij} = 1 | data)$.

Value

Update matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0).

See Also

fit2zig

Usage

```r
doEStep(countResiduals, zeroResiduals, zeroIndices)
```

Arguments

**countResiduals**
Residuals from the count model.

**zeroResiduals**
Residuals from the zero model.

**zeroIndices**
Index (matrix m x n) of counts that are zero/non-zero.

Details

Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership $\delta_{ij} = 1$ if $y_{ij}$ is generated from the zero point mass as latent indicator variables. The density is defined as $f_{zig}(y_{ij} = \pi_j(S_j) * f_0(y_{ij}) + (1-\pi_j(S_j)) * f_{count}(y_{ij};\mu_i,\sigma_i^2)$. The log-likelihood in this extended model is $\log(f_{count}(y_{ij};\mu_i,\sigma_i^2) + \delta_{ij} \log \pi_j(S_j))$. The responsibilities are defined as $z_{ij} = pr(\delta_{ij} = 1 | data)$.
doZeroMStep

Value

Updated matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0).

See Also

fitZig

---

doZeroMStep \hspace{2cm} Compute the zero Maximization step.

Description

Performs Maximization step calculation for the mixture components. Uses least squares to fit the parameters of the mean of the logistic distribution. $\pi_j = \sum_i^M \frac{1}{M} z_{ij}$ Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership $\delta_{ij} = 1$ if $y_{ij}$ is generated from the zero point mass as latent indicator variables. The density is defined as $f_{zig}(y_{ij} = \pi_j(S_j) \cdot f_0(y_{ij}) + (1-\pi_j(S_j)) \cdot f_{count}(y_{ij};\mu_i,\sigma_i^2)$.

The log-likelihood in this extended model is $(1-\delta_{ij}) \log f_{count}(y;\mu_i,\sigma_i^2) + \delta_{ij} \log \pi_j(s_j) + (1-\delta_{ij}) \log (1-\pi_j(s_j))$. The responsibilities are defined as $z_{ij} = pr(\delta_{ij}=1 | data)$.

Usage

doZeroMStep(z, zeroIndices, mmZero)

Arguments

- `z`: Matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0).
- `zeroIndices`: Index (matrix m x n) of counts that are zero/non-zero.
- `mmZero`: The zero model, the model matrix to account for the change in the number of OTUs observed as a linear effect of the depth of coverage.

Value

List of the zero fit (zero mean model) coefficients, variance - scale parameter (scalar), and normalized residuals of length sum(zeroIndices).

See Also

fitZig
**exportMat**

Export the normalized MRexperiment dataset as a matrix.

**Description**

This function allows the user to take a dataset of counts and output the dataset to the user’s workspace as a tab-delimited file, etc.

**Usage**

```r
exportMat(obj, log = TRUE, norm = TRUE, sep = "\t", file = "/Desktop/matrix.tsv")
```

**Arguments**

- `obj`: A MRexperiment object or count matrix.
- `log`: Whether or not to log transform the counts - if MRexperiment object.
- `norm`: Whether or not to normalize the counts - if MRexperiment object.
- `sep`: Separator for writing out the count matrix.
- `file`: Output file name.

**Value**

NA

**See Also**

`cumNorm`

**Examples**

```r
data(lungData)
dataDirectory <- system.file("extdata", package="metagenomeSeq")
exportMat(lungData[,1:5],file=file.path(dataDirectory,"tmp.tsv"))
head(read.csv(file=file.path(dataDirectory,"tmp.tsv"),sep="\t"))
```

**exportStats**

Various statistics of the count data.

**Description**

A matrix of values for each sample. The matrix consists of sample ids, the sample scaling factor, quantile value, the number identified features, and library size (depth of coverage).

**Usage**

```r
exportStats(obj, p = cumNormStat(obj), file = "~/Desktop/res.stats.tsv")
```
Arguments

obj A MRexperiment object with count data.
p Quantile value to calculate the scaling factor and quantiles for the various samples.
file Output file name.

Value

None.

See Also

cumNorm quantile

Examples

data(lungData)
dataDirectory <- system.file("extdata", package="metagenomeSeq")
exportStats(lungData[,1:5],file=file.path(dataDirectory,"tmp.tsv"))
head(read.csv(file=file.path(dataDirectory,"tmp.tsv"),sep="\t"))

expSummary Access MRexperiment object experiment data

Description

The expSummary vectors represent the column (sample specific) sums of features, i.e. the total number of reads for a sample, libSize and also the normalization factors, normFactor.

Usage

expSummary(obj)

Arguments

obj a MRexperiment object.

Value

Experiment summary table

Author(s)

Joseph N. Paulson, jspaulson@umiacs.umd.edu

Examples

data(mouseData)
expSummary(mouseData)
extractMR  

Extract the essentials of an MRexperiment.

Description

Extract the essentials of an MRexperiment.

Usage

```r
extractMR(obj)
```

Arguments

- `obj`  
  MRexperiment-class object.

Value

A list containing:

- `counts`: Count data
- `librarySize`: The column sums / library size / sequencing depth
- `normFactors`: The normalization scaling factors
- `pheno`: phenotype table
- `feat`: feature table

Examples

```r
data(mouseData)
head(metagenomeSeq:::extractMR(mouseData))
```

filterData  

Filter datasets according to no. features present in features with at least a certain depth.

Description

Filter the data based on the number of present features after filtering samples by depth of coverage. There are many ways to filter the object, this is just one way.

Usage

```r
filterData(obj, present = 1, depth = 1000)
```

Arguments

- `obj`  
  A MRexperiment object or count matrix.
- `present`  
  Features with at least 'present' positive samples.
- `depth`  
  Samples with at least this much depth of coverage
fitDO

Wrapper to calculate Discovery Odds Ratios on feature values.

Description

This function returns a data frame of p-values, odds ratios, lower and upper confidence limits for every row of a matrix. The discovery odds ratio is calculated as using Fisher’s exact test on actual counts. The test’s hypothesis is whether or not the discovery of counts for a feature (of all counts) is found in greater proportion in a particular group.

Usage

```r
fitDO(obj, cl, norm = TRUE, log = TRUE, adjust.method = "fdr",
cores = 1, ...)
```

Arguments

- `obj`: A MRexperiment object with a count matrix, or a simple count matrix.
- `cl`: Group comparison
- `norm`: Whether or not to normalize the counts - if MRexperiment object.
- `log`: Whether or not to log2 transform the counts - if MRexperiment object.
- `adjust.method`: Method to adjust p-values by. Default is "FDR". Options include "holm", "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none". See `p.adjust` for more details.
- `cores`: Number of cores to use.
- `...`: Extra options for makeCluster

Value

Matrix of odds ratios, p-values, lower and upper confidence intervals

See Also

cumNorm fitZig fitPA fitMeta
Examples

```r
data(lungData)
k = grep("Extraction.Control", pData(lungData)$SampleType)
lungTrim = lungData[-k]
lungTrim = lungTrim[-which(rowSums(MRcounts(lungTrim)>0)<20),]
res = fitDO(lungTrim, pData(lungTrim)$SmokingStatus);
head(res)
```

**fitFeatureModel**

Computes differential abundance analysis using a zero-inflated log-normal model

**Description**

Wrapper to actually run zero-inflated log-normal model given a MRexperiment object and model matrix. User can decide to shrink parameter estimates.

**Usage**

```r
fitFeatureModel(obj, mod, coef = 2, B = 1, szero = FALSE, spos = TRUE)
```

**Arguments**

- `obj`: A MRexperiment object with count data.
- `mod`: The model for the count distribution.
- `coef`: Coefficient of interest to grab log fold-changes.
- `B`: Number of bootstraps to perform if >1. If >1 performs permutation test.
- `szero`: TRUE/FALSE, shrink zero component parameters.
- `spos`: TRUE/FALSE, shrink positive component parameters.

**Value**

A list of objects including:

- call - the call made to fitFeatureModel
- fitZeroLogNormal - list of parameter estimates for the zero-inflated log normal model
- design - model matrix
- taxa - taxa names
- counts - count matrix
- pvalues - calculated p-values
- permuttedfits - permutted z-score estimates under the null

**See Also**

cumNorm
data(lungData)
lungData = lungData[,-which(is.na(pData(lungData)$SmokingStatus))]
lungData = filterData(lungData, present=30, depth=1)
lungData <- cumNorm(lungData, p=.5)
s <- normFactors(lungData)
pd <- pData(lungData)
mod <- model.matrix(~1+SmokingStatus, data=pd)
lungres1 = fitFeatureModel(lungData, mod)

fitLogNormal

Computes a log-normal linear model and permutation based p-values.

Description
Wrapper to perform the permutation test on the t-statistic. This is the original method employed by metastats (for non-sparse large samples). We include CSS normalization though (optional) and log2 transform the data. In this method the null distribution is not assumed to be a t-dist.

Usage
fitLogNormal(obj, mod, useCSSoffset = TRUE, B = 1000, coef = 2, sl = 1000)

Arguments
obj A MRexperiment object with count data.
mod The model for the count distribution.
useCSSoffset Boolean, whether to include the default scaling parameters in the model or not.
B Number of permutations.
coef The coefficient of interest.
sl The value to scale by (default=1000).

Value
Call made, fit object from lmFit, t-statistics and p-values for each feature.

Examples
# This is a simple demonstration
data(lungData)
k = grep("Extraction.Control", pData(lungData)$SampleType)
lungTrim = lungData[,-k]
k = which(rowSums(MRcounts(lungTrim)>0)<30)
lungTrim = cumNorm(lungTrim)
lungTrim = lungTrim[-k,]
smokingStatus = pData(lungTrim)$SmokingStatus
mod = model.matrix(~smokingStatus)
fit = fitLogNormal(obj = lungTrim, mod=mod, B=1)
fitMultipleTimeSeries

Discover differentially abundant time intervals for all bacteria

Description

Calculate time intervals of significant differential abundance over all bacteria of a particularly specified level (lvl). If not lvl is specified, all OTUs are analyzed. Warning, function can take a while

Usage

fitMultipleTimeSeries(obj, lvl = NULL, B = 1, featureOrder = NULL, ...)

Arguments

- obj: metagenomeSeq MRexperiment-class object.
- lvl: Vector or name of column in featureData of MRexperiment-class object for aggregating counts (if not OTU level).
- B: Number of permutations to perform.
- featureOrder: Hierarchy of levels in taxonomy as fData colnames
- ...: Options for fitTimeSeries, except feature.

Value

List of lists of matrices of time point intervals of interest, Difference in abundance area and p-value, fit, area permutations.

A list of lists for which each includes:

- timeIntervals: Matrix of time point intervals of interest, area of differential abundance, and pvalue.
- data: Data frame of abundance, class indicator, time, and id input.
- fit: Data frame of fitted values of the difference in abundance, standard error estimates and timepoints interpolated over.
- perm: Differential abundance area estimates for each permutation.
- call: Function call.

Examples

data(mouseData)
res = fitMultipleTimeSeries(obj=mouseData,lvl='phylum',class="status",
    id="mouseID",time="relativeTime",B=1)
fitPA

Wrapper to run fisher’s test on presence/absence of a feature.

Description

This function returns a data frame of p-values, odds ratios, lower and upper confidence limits for every row of a matrix.

Usage

fitPA(obj, cl, thres = 0, adjust.method = "fdr", cores = 1, ...)

Arguments

obj  
A MRexperiment object with a count matrix, or a simple count matrix.

cl  
Group comparison

thres  
Threshold for defining presence/absence.

adjust.method  
Method to adjust p-values by. Default is "FDR". Options include "holm", "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none". See p.adjust for more details.

cores  
Number of cores to use.

...  
Extra parameters for makeCluster

Value

Matrix of odds ratios, p-values, lower and upper confidence intervals

res = fitPA(lungTrim,pData(lungTrim)$SmokingStatus);
head(res)
fitSSTimeSeries  

Discover differentially abundant time intervals using SS-Anova

Description

Calculate time intervals of interest using SS-Anova fitted models. Fitting is performed uses Smoothing Spline ANOVA (SS-Anova) to find interesting intervals of time. Given observations at different time points for two groups, fitSSTimeSeries calculates a function that models the difference in abundance between two groups across all time. Using permutations we estimate a null distribution of areas for the time intervals of interest and report significant intervals of time. Use of the function for analyses should cite: "Finding regions of interest in high throughput genomics data using smoothing splines” Talukder H, Paulson JN, Bravo HC. (In preparation)

Usage

fitSSTimeSeries(obj, formula, feature, class, time, id, lvl = NULL, include = c("class", "time:class"), C = 0, B = 1000, norm = TRUE, log = TRUE, sl = 1000, featureOrder = NULL, ...)

Arguments

- **obj**: metagenomeSeq MRexperiment-class object.
- **formula**: Formula for ssanova. Of the form: abundance ~ ... where ... includes any pData slot value.
- **feature**: Name or row of feature of interest.
- **class**: Name of column in phenoData of MRexperiment-class object for class membership.
- **time**: Name of column in phenoData of MRexperiment-class object for relative time.
- **id**: Name of column in phenoData of MRexperiment-class object for sample id.
- **lvl**: Vector or name of column in featureData of MRexperiment-class object for aggregating counts (if not OTU level).
- **include**: Parameters to include in prediction.
- **C**: Value for which difference function has to be larger or smaller than (default 0).
- **B**: Number of permutations to perform
- **norm**: When aggregating counts to normalize or not.
- **log**: Log2 transform.
- **sl**: Scaling value.
- **featureOrder**: Hierarchy of levels in taxonomy as fData colnames
- **...**: Options for ssanova

Value

List of matrix of time point intervals of interest, Difference in abundance area and p-value, fit, area permutations, and call.

A list of objects including:
fitTimeSeries

- timeIntervals - Matrix of time point intervals of interest, area of differential abundance, and p-value.
- data - Data frame of abundance, class indicator, time, and id input.
- fit - Data frame of fitted values of the difference in abundance, standard error estimates and timepoints interpolated over.
- perm - Differential abundance area estimates for each permutation.
- call - Function call.

Examples

data(mouseData)
res = fitSSTimeSeries(obj=mouseData, feature="Actinobacteria", 
class="status", id="mouseID", time="relativeTime", lvl='class', B=2)

Description

Calculate time intervals of significant differential abundance. Currently only one method is implemented (ssanova). fitSSTimeSeries is called with method="ssanova".

Usage

fitTimeSeries(obj, formula, feature, class, time, id, method = c("ssanova"), 
lvl = NULL, include = c("class", "time:class"), C = 0, B = 1000, 
norm = TRUE, log = TRUE, sl = 1000, featureOrder = NULL, ...)

Arguments

obj metagenomeSeq MRexperiment-class object.
formula Formula for ssanova. Of the form: abundance ~ ... where ... includes any pData slot value.
feature Name or row of feature of interest.
class Name of column in phenoData of MRexperiment-class object for class membership.
time Name of column in phenoData of MRexperiment-class object for relative time.
id Name of column in phenoData of MRexperiment-class object for sample id.
method Method to estimate time intervals of differentially abundant bacteria (only ssanova method implemented currently).
lvl Vector or name of column in featureData of MRexperiment-class object for aggregating counts (if not OTU level).
include Parameters to include in prediction.
C Value for which difference function has to be larger or smaller than (default 0).
B Number of permutations to perform.
norm When aggregating counts to normalize or not.
log Log2 transform.
sL Scaling value.
featureOrder Hierarchy of levels in taxonomy as fData colnames
... Options for ssanova

Value
List of matrix of time point intervals of interest, Difference in abundance area and p-value, fit, area permutations, and call.
A list of objects including:
• timeIntervals - Matrix of time point intervals of interest, area of differential abundance, and pvalue.
• data - Data frame of abundance, class indicator, time, and id input.
• fit - Data frame of fitted values of the difference in abundance, standard error estimates and timepoints interpolated over.
• perm - Differential abundance area estimates for each permutation.
• call - Function call.

---
fitZeroLogNormal Compute the log fold-change estimates for the zero-inflated log-normal model

Description
Run the zero-inflated log-normal model given a MRexperiment object and model matrix. Not for the average user, assumes structure of the model matrix.

Usage
fitZeroLogNormal(obj, mod, coef = 2, szero = TRUE, spos = TRUE)
Arguments

- **obj**: A MRexperiment object with count data.
- **mod**: The model for the count distribution.
- **coef**: Coefficient of interest to grab log fold-changes.
- **szero**: TRUE/FALSE, shrink zero component parameters.
- **spos**: TRUE/FALSE, shrink positive component parameters.

Value

A list of objects including:

- logFC - the log fold-change estimates
- adjFactor - the adjustment factor based on the zero component
- se - standard error estimates
- fitln - parameters from the log-normal fit
- fitzero - parameters from the logistic fit
- zeroRidge - output from the ridge regression
- posRidge - output from the ridge regression
- tauPos - estimated tau^2 for positive component
- tauZero - estimated tau^2 for zero component
- exclude - features to exclude for various reasons, e.g. all zeros
- zeroExclude - features to exclude for various reasons, e.g. all zeros

**fitZig**

*Computes the weighted fold-change estimates and t-statistics.*

Description

Wrapper to actually run the Expectation-maximization algorithm and estimate $f_{\text{count}}$ fits. Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership $\delta_{ij} = 1$ if $y_{ij}$ is generated from the zero point mass as latent indicator variables. The density is defined as $f_{\text{zig}}(y_{ij} = \pi_j (S_j) * f_0(y_{ij}) + (1 - \pi_j (S_j)) * f_{\text{count}}(y_{ij}; \mu_i, \sigma_i^2)$$. The log-likelihood in this extended model is: $(1 - \delta_{ij}) \log f_{\text{count}}(y_{ij}; \mu_i, \sigma_i^2) + \delta_{ij} \log \pi_j (S_j) + (1 - \delta_{ij}) \log (1 - \pi_j (S_j))$. The responsibilities are defined as $z_{ij} = \text{pr}(\delta_{ij} = 1 | \text{data})$.

Usage

```r
fitZig(obj, mod, zeroMod = NULL, useCSSoffset = TRUE,
       control = zigControl(), useMixedModel = FALSE, ...)
```
fitZig

Arguments

obj A MRexperiment object with count data.

mod The model for the count distribution.

zeroMod The zero model, the model to account for the change in the number of OTUs observed as a linear effect of the depth of coverage.

useCSSoffset Boolean, whether to include the default scaling parameters in the model or not.

control The settings for fitZig.

useMixedModel Estimate the correlation between duplicate features or replicates using duplicateCorrelation.

... Additional parameters for duplicateCorrelation.

Value

A list of objects including:

• call - the call made to fitZig
• fit - 'MLArrayLM' Limma object of the weighted fit
• countResiduals - standardized residuals of the fit
• z - matrix of the posterior probabilities
• eb - output of eBayes, moderated t-statistics, moderated F-statistics, etc
• taxa - vector of the taxa names
• counts - the original count matrix input
• zeroMod - the zero model matrix
• zeroCoef - the zero model fitted results
• stillActive - convergence
• stillActiveNLL - nll at convergence
• dupcor - correlation of duplicates

**getCountDensity**  
Compute the value of the count density function from the count model residuals.

**Description**
Calculate density values from a normal: $f(x) = 1/(\sqrt{2\pi} \sigma) e^{-((x - \mu)^2)/(2\sigma^2)}$. Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership $\delta_{ij}$ = 1 if $y_{ij}$ is generated from the zero point mass as latent indicator variables. The density is defined as $f(y_{ij}) = \pi_j(S_j) f_0(y_{ij}) + (1-\pi_j(S_j)) f_{count}(y_{ij};\mu_i,\sigma_i^2)$. The log-likelihood in this extended model is $(1-\delta_{ij}) \log f_{count}(y;\mu_i,\sigma_i^2) + \delta_{ij} \log \pi_j(s_j) + (1-\delta_{ij}) \log (1-\pi_j(s_j))$. The responsibilities are defined as $z_{ij} = pr(\delta_{ij}=1 | data)$.

**Usage**
```
getCountDensity(residuals, log = FALSE)
```

**Arguments**
- `residuals`: Residuals from the count model.
- `log`: Whether or not we are calculating from a log-normal distribution.

**Value**
Density values from the count model residuals.

**See Also**
- fitZig

**getEpsilon**  
Calculate the relative difference between iterations of the negative log-likelihoods.

**Description**
Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership $\delta_{ij}$ = 1 if $y_{ij}$ is generated from the zero point mass as latent indicator variables. The log-likelihood in this extended model is $(1-\delta_{ij}) \log f_{count}(y;\mu_i,\sigma_i^2) + \delta_{ij} \log \pi_j(s_j) + (1-\delta_{ij}) \log (1-\pi_j(s_j))$. The responsibilities are defined as $z_{ij} = pr(\delta_{ij}=1 | data)$.

**Usage**
```
getEpsilon(nll, nllOld)
```

**Arguments**
- `nll`: Vector of size M with the current negative log-likelihoods.
- `nllOld`: Vector of size M with the previous iterations negative log-likelihoods.
getNegativeLogLikelihoods

Value

Vector of size M of the relative differences between the previous and current iteration nll.

See Also

fitZig

Description

Maximum-likelihood estimates are approximated using the EM algorithm where we treat mixture membership $\delta_{ij} = 1$ if $y_{ij}$ is generated from the zero point mass as latent indicator variables. The log-likelihood in this extended model is $(1-\delta_{ij}) \log f_{\text{count}}(y_{ij}|\mu_i,\sigma_i^2) + \delta_{ij} \log \pi_j(s_j) + (1-\delta_{ij}) \log (1 - \pi_j(s_j))$. The responsibilities are defined as $z_{ij} = \Pr(\delta_{ij}=1 | \text{data and current values})$.

Usage

getNegativeLogLikelihoods(z, countResiduals, zeroResiduals)

Arguments

z Matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0).

countResiduals Residuals from the count model.

zeroResiduals Residuals from the zero model.

Value

Vector of size M of the negative log-likelihoods for the various features.

See Also

fitZig
getPi

Calculate the mixture proportions from the zero model / spike mass model residuals.

Description
F(x) = 1 / (1 + exp(-(x-m)/s)) (the CDF of the logistic distribution). Provides the probability that a real-valued random variable X with a given probability distribution will be found at a value less than or equal to x. The output are the mixture proportions for the samples given the residuals from the zero model.

Usage
getPi(residuals)

Arguments
residuals Residuals from the zero model.

Value
Mixture proportions for each sample.

See Also
fitZig

getZ

Calculate the current Z estimate responsibilities (posterior probabilities)

Description
Calculate the current Z estimate responsibilities (posterior probabilities)

Usage
getz(z, zUsed, stillActive, n1l, n1lUSED)

Arguments
z Matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0).
zUsed Matrix (m x n) of estimate responsibilities (probabilities that a count comes from a spike distribution at 0) that are actually used (following convergence).
stillActive A vector of size M booleans saying if a feature is still active or not.
n1l Vector of size M with the current negative log-likelihoods.
n1lUSED Vector of size M with the converged negative log-likelihoods.
isItStillActive

Value

A list of updated zUsed and nllUSED.

See Also

fitZig

---

isItStillActive  Function to determine if a feature is still active.

Description

In the Expectation Maximization routine features posterior probabilities routinely converge based on a tolerance threshold. This function checks whether or not the feature’s negative log-likelihood (measure of the fit) has changed or not.

Usage

isItStillActive(eps, tol, stillActive, stillActiveNLL, nll)

Arguments

eps  Vector of size M (features) representing the relative difference between the new nll and old nll.

tol  The threshold tolerance for the difference

stillActive  A vector of size M booleans saying if a feature is still active or not.

stillActiveNLL  A vector of size M recording the negative log-likelihoods of the various features, updated for those still active.

nll  Vector of size M with the current negative log-likelihoods.

Value

None.

See Also

fitZig
libSize

Access sample depth of coverage from MRexperiment object

Description
Access the libSize vector represents the column (sample specific) sums of features, i.e. the total number of reads for a sample or depth of coverage. It is used by fitZig.

Usage
libSize(object)

Arguments
object a MRexperiment object

Value
Library sizes

Author(s)
Joseph N. Paulson

Examples

data(lungData)
head(libSize(lungData))

libSize<- Replace the library sizes in a MRexperiment object

Description
Function to replace the scaling factors, aka the library sizes, of samples in a MRexperiment object.

Usage
## S4 replacement method for signature 'MRexperiment,numeric'
libSize(object) <- value

Arguments
object a MRexperiment object
value vector of library sizes

Value
vector library sizes
loadBiom

Author(s)

Joseph N. Paulson

Examples

data(lungData)
head(libSize(lungData)<- rnorm(1))

loadBiom

Load objects organized in the Biom format.

Description

Wrapper to load Biom formatted object.

Usage

loadBiom(file)

Arguments

file The biom object filepath.

Value

A MRexperiment object.

See Also

loadMeta loadPhenoData newMRexperiment biom2MRexperiment

Examples

#library(biomformat)
rich_dense_file = system.file("extdata", "rich_dense_otu_table.biom", package = "biomformat")
x = loadBiom(rich_dense_file)
x
loadMeta

Load a count dataset associated with a study.

Description
Load a matrix of OTUs in a tab delimited format

Usage
loadMeta(file, sep = "\t")

Arguments

  file  Path and filename of the actual data file.
  sep   File delimiter.

Value
  A list with objects 'counts' and 'taxa'.

See Also
loadPhenoData

Examples

  dataDirectory <- system.file("extdata", package="metagenomeSeq")
  lung = loadMeta(file.path(dataDirectory,"CHK_NAME.otus.count.csv"))

loadMetaQ

Load a count dataset associated with a study set up in a Qiime format.

Description
Load a matrix of OTUs in Qiime's format

Usage
loadMetaQ(file)

Arguments

  file  Path and filename of the actual data file.

Value
  An list with 'counts' containing the count data, 'taxa' containing the otu annotation, and 'otus'.
**loadPhenoData**

Load a clinical/phenotypic dataset associated with a study.

### Description

Load a matrix of metadata associated with a study.

### Usage

```r
loadPhenoData(file, tran = TRUE, sep = "\t")
```

### Arguments

- **file**
  Path and filename of the actual clinical file.
- **tran**
  Boolean. If the covariates are along the columns and samples along the rows, then tran should equal TRUE.
- **sep**
  The separator for the file.

### Value

The metadata as a dataframe.

### See Also

- `loadMeta`

### Examples

```r
dataDirectory <- system.file("extdata", package="metagenomeSeq")
clin = loadPhenoData(file.path(dataDirectory,"CHK_clinical.csv"), tran=TRUE)
```
makeLabels

**Description**

OTU abundance matrix of samples from a smoker/non-smoker study

**Usage**

`lungData`

**Format**

A list of OTU matrix, taxa, otus, and phenotypes

**Value**

MRexperiment-class object of 16S lung samples.

**References**

---

makeLabels

**Description**

Function to make labels simpler

**Usage**

`makeLabels(x = "samples", y = "abundance", norm, log)`

**Arguments**

- `x` string for the x-axis
- `y` string for the y-axis
- `norm` is the data normalized?
- `log` is the data logged?

**Value**

vector of x,y labels

**Examples**

```
metagenomeSeq::makeLabels(norm=TRUE, log=TRUE)
```
mergeMRe xperiments

Merge two M Rexperiment objects together

Description
This function will take two M Rexperiment objects and merge them together finding common OTUs. If there are OTUs not found in one of the two M Rexperiments then a message will announce this and values will be coerced to zero for the second table.

Usage
mergeMRe xperiments(x, y)

Arguments
x          MRexperiment-class object 1.
y          MRexperiment-class object 2.

Value
Merged MRexperiment-class object.

Examples

data(mouseData)
newobj = mergeMRe xperiments(mouseData, mouseData)
newobj

# let me know if people are interested in an option to merge by keys instead of row names.
data(lungData)
newobj = mergeMRe xperiments(mouseData, lungData)
newobj

mergeTable

Merge two tables

Description
Merge two tables

Usage
mergeTable(x, y)

Arguments
x          Table 1.
y          Table 2.

Value
Merged table
Deprecation

These functions may be removed completely in the next release.

Usage

deprecated_metagenomeSeq_function(x, value, ...)

Arguments

x  For assignment operators, the object that will undergo a replacement (object inside parenthesis).
value  For assignment operators, the value to replace with (the right side of the assignment).
...  For functions other than assignment operators, parameters to be passed to the modern version of the function (see table).

Description

This is a list with a matrix of OTU counts, taxa annotations for each OTU, otu names, and vector of phenotypic data. Samples along the columns and OTUs along the rows.

Usage

mouseData

Format

A list of OTU matrix, taxa, otus, and phenotypes

Value

MRexperiment-class object of 16S mouse samples.

References

http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2894525/
### MRcoefs

**Table of top-ranked features from fitZig or fitFeatureModel**

#### Description

Extract a table of the top-ranked features from a linear model fit. This function will be updated soon to provide better flexibility similar to limma’s topTable.

#### Usage

```r
MRcoefs(obj, by = 2, coef = NULL, number = 10, taxa = obj$taxa,
         uniqueNames = FALSE, adjustMethod = "fdr", group = 0, eff = 0,
         numberEff = FALSE, counts = 0, file = NULL)
```

#### Arguments

- **obj**: Output of fitFeatureModel or fitZig.
- **by**: Column number or column name specifying which coefficient or contrast of the linear model is of interest.
- **coef**: Column number(s) or column name(s) specifying which coefficient or contrast of the linear model to display.
- **number**: The number of bacterial features to pick out.
- **taxa**: Taxa list.
- **uniqueNames**: Number the various taxa.
- **adjustMethod**: Method to adjust p-values by. Default is "FDR". Options include "holm", "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none". See `p.adjust` for more details.
- **group**: One of five choices, 0,1,2,3,4. 0: the sort is ordered by a decreasing absolute value coefficient fit. 1: the sort is ordered by the raw coefficient fit in decreasing order. 2: the sort is ordered by the raw coefficient fit in increasing order. 3: the sort is ordered by the p-value of the coefficient fit in increasing order. 4: no sorting.
- **eff**: Filter features to have at least a "eff" quantile or number of effective samples.
- **numberEff**: Boolean, whether eff should represent quantile (default/FALSE) or number.
- **counts**: Filter features to have at least 'counts' counts.
- **file**: Name of output file, including location, to save the table.

#### Value

Table of the top-ranked features determined by the linear fit’s coefficient.

#### See Also

- `fitZig`
- `fitFeatureModel`
- `MRtable`
- `MRfulltable`
Examples

```r
data(lungData)
k = grep("Extraction.Control", pData(lungData)$SampleType)
lungTrim = lungData[-k]
lungTrim = filterData(lungTrim, present=30)
lungTrim = cumNorm(lungTrim, p=0.5)
smokingStatus = pData(lungTrim)$SmokingStatus
mod = model.matrix(~smokingStatus)
fit = fitZig(obj = lungTrim, mod=mod)
head(MRcoefs(fit))
###
fit = fitFeatureModel(obj = lungTrim, mod=mod)
head(MRcoefs(fit))
```

---

**MRcounts**  
*Accessor for the counts slot of a MRexperiment object*

**Description**

The counts slot holds the raw count data representing (along the rows) the number of reads annotated for a particular feature and (along the columns) the sample.

**Usage**

```r
MRcounts(obj, norm = FALSE, log = FALSE, sl = 1000)
```

**Arguments**

- `obj`: a MRexperiment object.
- `norm`: logical indicating whether or not to return normalized counts.
- `log`: TRUE/FALSE whether or not to log2 transform scale.
- `sl`: The value to scale by (default=1000).

**Value**

Normalized or raw counts

**Author(s)**

Joseph N. Paulson, jpaulson@umiacs.umd.edu

**Examples**

```r
data(lungData)
head(MRcounts(lungData))
```
**MRexperiment**

Class "MRexperiment" – a modified eSet object for the data from high-throughput sequencing experiments

---

**Description**

This is the main class for metagenomeSeq.

**Objects from the Class**

Objects should be created with calls to `newMRexperiment`.

**Extends**

Class `eSet` (package `Biobase`), directly. Class `VersionedBiobase` (package `Biobase`), by class "eSet", distance 2. Class `Versioned` (package `Biobase`), by class "eSet", distance 3.

**Methods**

Class-specific methods.

[ Subset operation, taking two arguments and indexing the sample and variable. Returns an MRexperiment object, including relevant metadata. Setting drop=TRUE generates an error. Subsetting the data, the experiment summary slot is repopulated and pData is repopulated after calling factor (removing levels not present).

**Note**

Note: This is a summary for reference. For an explanation of the actual usage, see the vignette.

MRexperiments are the main class in use by metagenomeSeq. The class extends eSet and provides additional slots which are populated during the analysis pipeline.

MRexperiment dataset are created with calls to `newMRexperiment`. MRexperiment datasets contain raw count matrices (integers) accessible through `MRcounts`. Similarly, normalized count matrices can be accessed (following normalization) through `MRcounts` by calling norm=TRUE. Following an analysis, a matrix of posterior probabilities for counts is accessible through `posteriorProbs`.

The normalization factors used in analysis can be recovered by `normFactors`, as can the library sizes of samples (depths of coverage), `libSize`.

Similarly to other RNASeq bioconductor packages available, the rows of the matrix correspond to a feature (be it OTU, species, gene, etc.) and each column an experimental sample. Pertinent clinical information and potential confounding factors are stored in the phenoData slot (accessed via `pData`).

To populate the various slots in an MRexperiment several functions are run. 1) `cumNormStat` calculates the proper percentile to calculate normalization factors. The `cumNormStat` slot is populated.

2) `cumNorm` calculates the actual normalization factors using p = cumNormStat.

Other functions will place subsequent matrices (normalized counts (`cumNormMat`), posterior probabilities (`posteriorProbs`))

As mentioned above, MRexperiment is derived from the virtual class, eSet and thereby has a phenoData slot which allows for sample annotation. In the phenoData data frame factors are stored. The normalization factors and library size information is stored in a slot called expSummary that is an annotated data frame and is repopulated for subsetted data.
MRexperiment2biom

Description

Wrapper to convert MRexperiment objects to biom objects.

Usage

MRexperiment2biom(obj, id = NULL, norm = FALSE, log = FALSE, sl = 1000, qiimeVersion = TRUE)

Arguments

obj The MRexperiment object.
id Optional id for the biom matrix.
norm normalize count table
log log2 transform count table
sl scaling factor for normalized counts.
qiimeVersion Format fData according to QIIME specifications (assumes only taxonomy in fData).

Value

A biom object.

MRfulltable

Description

Extract a table of the top-ranked features from a linear model fit. This function will be updated soon to provide better flexibility similar to limma’s topTable. This function differs from link{MRcoefs} in that it provides other information about the presence or absence of features to help ensure significant features called are moderately present.

Usage

MRfulltable(obj, by = 2, coef = NULL, number = 10, taxa = obj$taxa, uniqueNames = FALSE, adjustMethod = “fdr”, group = 0, eff = 0, numberEff = FALSE, ncounts = 0, file = NULL)
Arguments

obj  A list containing the linear model fit produced by lmFit through fitZig.
by  Column number or column name specifying which coefficient or contrast of the linear model is of interest.
coef  Column number(s) or column name(s) specifying which coefficient or contrast of the linear model to display.
number  The number of bacterial features to pick out.
taxa  Taxa list.
uniqueNames  Number the various taxa.
adjustMethod  Method to adjust p-values by. Default is "FDR". Options include "holm", "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none". See p.adjust for more details.
group  One of five choices: 0,1,2,3,4. 0: the sort is ordered by a decreasing absolute value coefficient fit. 1: the sort is ordered by the raw coefficient fit in decreasing order. 2: the sort is ordered by the raw coefficient fit in increasing order. 3: the sort is ordered by the p-value of the coefficient fit in increasing order. 4: no sorting.
eff  Filter features to have at least a "eff" quantile or number of effective samples.
numberEff  Boolean, whether eff should represent quantile (default/FALSE) or number.
counts  Filter features to those with at least 'counts' counts.
file  Name of output file, including location, to save the table.

Value

Table of the top-ranked features determined by the linear fit’s coefficient.

MRtable

Table of top microbial marker gene from linear model fit including sequence information

Description

Extract a table of the top-ranked features from a linear model fit. This function will be updated soon to provide better flexibility similar to limma’s topTable. This function differs from link{MRcoefs} in that it provides other information about the presence or absence of features to help ensure significant features called are moderately present.

Usage

MRtable(obj, by = 2, coef = NULL, number = 10, taxa = obj$taxa,
uniqueNames = FALSE, adjustMethod = "fdr", group = 0, eff = 0,
numberEff = FALSE, ncounts = 0, file = NULL)

Arguments

- **obj**: Output of fitFeatureModel or fitZig.
- **by**: Column number or column name specifying which coefficient or contrast of the linear model is of interest.
- **coef**: Column number(s) or column name(s) specifying which coefficient or contrast of the linear model to display.
- **number**: The number of bacterial features to pick out.
- **taxa**: Taxa list.
- **uniqueNames**: Number the various taxa.
- **adjustMethod**: Method to adjust p-values by. Default is "FDR". Options include "holm", "hochberg", "hommel", "bonferroni", "BH", "BY", "fdr", "none". See p.adjust for more details.
- **group**: One of five choices, 0,1,2,3,4. 0: the sort is ordered by a decreasing absolute value coefficient fit. 1: the sort is ordered by the raw coefficient fit in decreasing order. 2: the sort is ordered by the raw coefficient fit in increasing order. 3: the sort is ordered by the p-value of the coefficient fit in increasing order. 4: no sorting.
- **eff**: Filter features to have at least a "eff" quantile or number of effective samples.
- **numberEff**: Boolean, whether eff should represent quantile (default/FALSE) or number.
- **ncounts**: Filter features to have at least 'counts' of counts.
- **file**: Name of file, including location, to save the table.

Value

Table of the top-ranked features determined by the linear fit’s coefficient.

newMRexperiment  
Create a MRexperiment object

Description

This function creates a MRexperiment object from a matrix or data frame of count data.

Usage

newMRexperiment(counts, phenoData = NULL, featureData = NULL,
libSize = NULL, normFactors = NULL)

Arguments

counts  
A matrix or data frame of count data. The count data is representative of the number of reads annotated for a feature (be it gene, OTU, species, etc). Rows should correspond to features and columns to samples.

phenoData  
An AnnotatedDataFrame with pertinent sample information.

featureData  
An AnnotatedDataFrame with pertinent feature information.

libSize  
libSize, library size, is the total number of reads for a particular sample.

normFactors  
normFactors, the normalization factors used in either the model or as scaling factors of sample counts for each particular sample.

Details

See MRexperiment-class and eSet (from the Biobase package) for the meaning of the various slots.

Value

an object of class MRexperiment

Author(s)

Joseph N Paulson
Examples

cnts = matrix(abs(rnorm(1000)),nc=10)
obj <- newMRexperiment(cnts)

Description

Function to access the scaling factors, aka the normalization factors, of samples in a MReperiment object.

Usage

normFactors(object)

Arguments

object  
a MReperiment object

Value

Normalization scaling factors

Author(s)

Joseph N. Paulson

Examples

data(lungData)
head(normFactors(lungData))

Description

Function to replace the scaling factors, aka the normalization factors, of samples in a MReperiment object.

Usage

## S4 replacement method for signature 'MReperiment,numeric'
normFactors(object) <- value
**plotBubble**

### Arguments

- **object** a MReperiment object
- **value** vector of normalization scaling factors

### Value

Normalization scaling factors

### Author(s)

Joseph N. Paulson

### Examples

```r
data(lungData)
head(normFactors(lungData) <- rnorm(1))
```

---

**plotBubble** Basic plot of binned vectors.

### Description

This function plots takes two vectors, calculates the contingency table and plots circles sized by the contingency table value. Optional significance vectors of the values significant will shade the circles by proportion of significance.

### Usage

```r
plotBubble(yvector, xvector, sigvector = NULL, nbreaks = 10,
ybreak = quantile(yvector, p = seq(0, 1, length.out = nbreaks)),
xbreak = quantile(xvector, p = seq(0, 1, length.out = nbreaks)),
scale = 1, local = FALSE, ...)
```

### Arguments

- **yvector** A vector of values represented along y-axis.
- **xvector** A vector of values represented along x-axis.
- **sigvector** A vector of the names of significant features (names should match x/yvector).
- **nbreaks** Number of bins to break yvector and xvector into.
- **ybreak** The values to break the yvector at.
- **xbreak** The values to break the xvector at.
- **scale** Scaling of circle bin sizes.
- **local** Boolean to shade by significant bin numbers (TRUE) or overall proportion (FALSE).
- **...** Additional plot arguments.

### Value

A matrix of features along rows, and the group membership along columns.
plotClassTimeSeries

Plot abundances by class

Description

Plot the abundance of values for each class using a spline approach on the estimated full model.

Usage

plotClassTimeSeries(res, formula, xlab = "Time", ylab = "Abundance", color0 = "black", color1 = "red", include = c("1", "class", "time:class"), ...)

Arguments

res Output of fitTimeSeries function
formula Formula for ssanova. Of the form: abundance ~ ... where ... includes any pData slot value.
xlab X-label.
ylab Y-label.
color0 Color of samples from first group.
color1 Color of samples from second group.
include Parameters to include in prediction.
... Extra plotting arguments.

Value

Plot for abundances of each class using a spline approach on estimated null model.

See Also

fitTimeSeries

Examples

data(mouseData)
mouseData = mouseData[which(rowSums(mouseData)>139),]
sparsity = rowMeans(MRcounts(mouseData)==0)
lor = log(fitPA(mouseData,cl=pData(mouseData)[,3])$oddsRatio)
plotBubble(lor,sparsity,main="lor ~ sparsity")
# Example 2
x = runif(100000)
y = runif(100000)
plotBubble(y,x)
plotCorr

Examples

data(mouseData)
res = fitTimeSeries(obj=mouseData, feature="Actinobacteria",
class="status", id="mouseID", time="relativeTime", lvl='class', B=10)
plotClassTimeSeries(res, pch=21, bg=res$data$class, ylim=c(0, 8))

plotCorr

Basic correlation plot function for normalized or unnormalized counts.

Description

This function plots a heatmap of the "n" features with greatest variance across rows.

Usage

plotCorr(obj, n, norm = TRUE, log = TRUE, fun = cor, ...)

Arguments

obj A MRexperiment object with count data.
n The number of features to plot. This chooses the "n" features with greatest variance.
norm Whether or not to normalize the counts - if MRexperiment object.
log Whether or not to log2 transform the counts - if MRexperiment object.
fun Function to calculate pair-wise relationships. Default is pearson correlation
... Additional plot arguments.

Value

plotted correlation matrix

See Also

cumNormMat

Examples

data(mouseData)
plotCorr(obj=mouseData, n=200, cexRow = 0.4, cexCol = 0.4, trace="none", dendrogram="none",
col = colorRampPalette(brewer.pal(9, "RdBu"))(50))
plotFeature

Basic plot function of the raw or normalized data.

Description

This function plots the abundance of a particular OTU by class. The function is the typical manhattan plot of the abundances.

Usage

plotFeature(obj, otuIndex, classIndex, col = "black", sort = TRUE, sortby = NULL, norm = TRUE, log = TRUE, sl = 1000, ...)

Arguments

obj A MRexperiment object with count data.
otuIndex The row to plot
classIndex A list of the samples in their respective groups.
col A vector to color samples by.
sort Boolean, sort or not.
sortby Default is sort by library size, alternative vector for sorting
norm Whether or not to normalize the counts - if MRexperiment object.
log Whether or not to log2 transform the counts - if MRexperiment object.
sl Scaling factor - if MRexperiment and norm=TRUE.
... Additional plot arguments.

Value
counts and classindex

See Also
cumNorm

Examples

data(mouseData)
classIndex=list(Western=which(pData(mouseData)$diet=="Western"))
classIndex$BK=which(pData(mouseData)$diet=="BK")
fileIndex = 8770

par(mfrow=c(2,1))
dates = pData(mouseData)$date
plotFeature(mouseData,norm=FALSE,log=FALSE,otuIndex,classIndex, col=dates,sortby=dates,ylab="Raw reads")
**Description**

This function plots the abundance of a particular OTU by class. The function uses the estimated posterior probabilities to make technical zeros transparent.

**Usage**

```r
plotGenus(obj, otuIndex, classIndex, norm = TRUE, log = TRUE,
          no = 1:length(otuIndex), labs = TRUE, xlab = NULL, ylab = NULL,
          jitter = TRUE, jitter.factor = 1, pch = 21, ...)
```

**Arguments**

- **obj** An MRexperiment object with count data.
- **otuIndex** A list of the otus with the same annotation.
- **classIndex** A list of the samples in their respective groups.
- **norm** Whether or not to normalize the counts - if MRexperiment object.
- **log** Whether or not to log2 transform the counts - if MRexperiment object.
- **no** Which of the otuIndex to plot.
- **labs** Whether to include group labels or not. (TRUE/FALSE)
- **xlab** xlabel for the plot.
- **ylab** ylabel for the plot.
- **jitter** Boolean to jitter the count data or not.
- **jitter.factor** Factor value for jitter
- **pch** Standard pch value for the plot command.
- **...** Additional plot arguments.

**Value**

plotted data

**See Also**

cumNorm

**Examples**

```r
data(mouseData)
classIndex=list(controls=which(pData(mouseData)$diet=="BK"))
classIndex$cases=which(pData(mouseData)$diet=="Western")
ctuIndex = grep("Strep",fData(mouseData)$family)
ctuIndex=ctuIndex[order(rowSums(MRcounts(mouseData)[ctuIndex,]),decreasing=TRUE)]
plotGenus(mouseData,ctuIndex,classIndex,no=1:2,xaxt="n",norm=FALSE,ylab="Strep normalized log(cpt)")
```
plotMRheatmap

Basic heatmap plot function for normalized counts.

Description

This function plots a heatmap of the 'n' features with greatest variance across rows (or other statistic).

Usage

plotMRheatmap(obj, n, norm = TRUE, log = TRUE, fun = sd, ...)

Arguments

obj A MRexperiment object with count data.

n The number of features to plot. This chooses the 'n' features of greatest positive statistic.

norm Whether or not to normalize the counts - if MRexperiment object.

log Whether or not to log2 transform the counts - if MRexperiment object.

fun Function to select top 'n' features.

... Additional plot arguments.

Value

plotted matrix

See Also

cumNormMat

Examples

data(mouseData)
trials = pData(mouseData)$diet
heatmapColColors=brewer.pal(12,"Set3")[as.integer(factor(trials))];
heatmapCols = colorRampPalette(brewer.pal(9, "RdBu"))(50)
#### version using sd
plotMRheatmap(obj=mouseData,n=200,cexRow = 0.4,cexCol = 0.4,trace="none",
col = heatmapCols,ColSideColors = heatmapColColors)
#### version using MAD
plotMRheatmap(obj=mouseData,n=50,fun=mad,cexRow = 0.4,cexCol = 0.4,trace="none",
col = heatmapCols,ColSideColors = heatmapColColors)
plotOrd

Plot of either PCA or MDS coordinates for the distances of normalized or unnormalized counts.

Description

This function plots the PCA / MDS coordinates for the "n" features of interest. Potentially uncovering batch effects or feature relationships.

Usage

plotOrd(obj, tran = TRUE, comp = 1:2, norm = TRUE, log = TRUE, usePCA = TRUE, useDist = FALSE, distfun = stats::dist, dist.method = "euclidian", n = NULL, ...)

Arguments

obj A MRexperiment object or count matrix.
tran Transpose the matrix.
comp Which components to display
norm Whether or not to normalize the counts - if MRexperiment object.
log Whether or not to log2 the counts - if MRexperiment object.
usePCA TRUE/FALSE whether to use PCA or MDS coordinates (TRUE is PCA).
useDist TRUE/FALSE whether to calculate distances.
distfun Distance function, default is stats::dist
dist.method If useDist==TRUE, what method to calculate distances.
n Number of features to make use of in calculating your distances.
... Additional plot arguments.

Value

coordinates

See Also

cumNormMat

Examples

data(mouseData)
c1 = pData(mouseData)[,3]
plotOrd(mouseData, tran=TRUE, useDist=TRUE, pch=21, bg=factor(c1), usePCA=FALSE)
plotOTU

Basic plot function of the raw or normalized data.

Description

This function plots the abundance of a particular OTU by class. The function uses the estimated posterior probabilities to make technical zeros transparent.

Usage

plotOTU(obj, otu, classIndex, log = TRUE, norm = TRUE, jitter.factor = 1, pch = 21, labs = TRUE, xlab = NULL, ylab = NULL, jitter = TRUE, ...)

Arguments

obj
A MRexperiment object with count data.

otu
The row number/OTU to plot.

classIndex
A list of the samples in their respective groups.

log
Whether or not to log2 transform the counts - if MRexperiment object.

norm
Whether or not to normalize the counts - if MRexperiment object.

jitter.factor
Factor value for jitter.

pch
Standard pch value for the plot command.

labs
Whether to include group labels or not. (TRUE/FALSE)

xlab
xlabel for the plot.

ylab
ylabel for the plot.

jitter
Boolean to jitter the count data or not.

...
Additional plot arguments.

Value

Plotted values

See Also

cumNorm

Examples

data(mouseData)
classIndex=list(controls=which(pData(mouseData)$diet=="BK"))
classIndex$cases=which(pData(mouseData)$diet=="Western")

# you can specify whether or not to normalize, and to what level
plotOTU(mouseData,otu=9083,classIndex,norm=FALSE,main="9083 feature abundances")
plotRare

Plot of rarefaction effect

Description
This function plots the number of observed features vs. the depth of coverage.

Usage
plotRare(obj, cl = NULL, ...)

Arguments
obj A MRexperiment object with count data or matrix.
cl Vector of classes for various samples.
... Additional plot arguments.

Value
Library size and number of detected features

See Also
plotOrd, plotMRheatmap, plotCorr, plotOTU, plotGenus

Examples

data(mouseData)
cl = factor(pData(mouseData)[,3])
res = plotRare(mouseData,cl=cl,pch=21,bg=cl)
tmp=lapply(levels(cl), function(lv) lm(res[,"ident"]~res[,"libSize"]-1, subset=cl==lv))
for(i in 1:length(levels(cl))){
  abline(tmp[[i]], col=i)
}
legend("topleft", c("Diet 1","Diet 2"), text.col=c(1,2),box.col=NA)

plotTimeSeries
Plot difference function for particular bacteria

Description
Plot the difference in abundance for significant features.

Usage
plotTimeSeries(res, C = 0, xlab = "Time",
ylab = "Difference in abundance",
main = "SS difference function prediction", ...)
Arguments

- **res**: Output of `fitTimeSeries` function.
- **C**: Value for which difference function has to be larger or smaller than (default 0).
- **xlab**: X-label.
- **ylab**: Y-label.
- **main**: Main label.
- **...**: Extra plotting arguments.

Value

Plot of difference in abundance for significant features.

See Also

- `fitTimeSeries`

Examples

```r
data(mouseData)
res = fitTimeSeries(obj=mouseData, feature="Actinobacteria", 
  class="status", id="mouseID", time="relativeTime", lvl='class', B=10)
plotTimeSeries(res)
```

---

**posteriorProbs**

Access the posterior probabilities that results from analysis

Description

Accessing the posterior probabilities following a run through `fitZig`

Usage

```r
posteriorProbs(obj)
```

Arguments

- **obj**: a MRexperiment object.

Value

Matrix of posterior probabilities

Author(s)

Joseph N. Paulson
Examples

# This is a simple demonstration
data(lungData)
k = grep("Extraction.Control", pData(lungData)$SampleType)
lungTrim = lungData[,-k]
k = which(rowSums(MRcounts(lungTrim)>0)<30)
lungTrim = cumNorm(lungTrim)
lungTrim = lungTrim[-k,]
smokingStatus = pData(lungTrim)$SmokingStatus
mod = model.matrix(~smokingStatus)
# The maxit is not meant to be 1 - this is for demonstration/speed
settings = zigControl(maxit=1, verbose=FALSE)
fit = fitZig(obj = lungTrim, mod=mod, control=settings)
head(posteriorProbs(lungTrim))

returnAppropriateObj  Check if MRexperiment or matrix and return matrix

Description

Function to check if object is a MRexperiment class or matrix

Usage

returnAppropriateObj(obj, norm, log, sl = 1000)

Arguments

obj a MRexperiment or matrix object
norm return a normalized MRexperiment matrix
log return a log transformed MRexperiment matrix
sl scaling value

Value

Matrix

Examples

data(lungData)
head(returnAppropriateObj(lungData,norm=FALSE,log=FALSE))
Description

Sets up a data-frame with the feature abundance, class information, time points, sample ids and returns the fitted values for the fitted model.

Usage

ssFit(formula, abundance, class, time, id, include = c("class", "time:class"), pd, ...)

Arguments

 formula Formula for ssanova. Of the form: abundance ~ ... where ... includes any pData slot value.
 abundance Numeric vector of abundances.
 class Class membership (factor of group membership).
 time Time point vector of relative times (same length as abundance).
 id Sample / patient id.
 include Parameters to include in prediction.
 pd Extra variable.
 ... Extra parameters for ssanova function (see ?ssanova).

Value

A list containing:

 data : Inputed data
  fit : The interpolated / fitted values for timePoints
  se : The standard error for CI intervals
  timePoints : The time points interpolated over

See Also

cumNorm fitTimeSeries ssPermAnalysis ssPerm ssIntervalCandidate

Examples

# Not run
**ssIntervalCandidate**

*calculate interesting time intervals*

**Description**

Calculates time intervals of interest using SS-Anova fitted confidence intervals.

**Usage**

```r
ssIntervalCandidate(fit, standardError, timePoints, positive = TRUE, C = 0)
```

**Arguments**

- `fit`: SS-Anova fits.
- `standardError`: SS-Anova se estimates.
- `timePoints`: Time points interpolated over.
- `positive`: Positive region or negative region (difference in abundance is positive/negative).
- `C`: Value for which difference function has to be larger or smaller than (default 0).

**Value**

Matrix of time point intervals of interest

**See Also**

`cumNorm`, `fitTimeSeries`, `ssFit`, `ssPerm`, `ssPermAnalysis`

**Examples**

```r
# Not run
```

---

**ssPerm**

*class permutations for smoothing-spline time series analysis*

**Description**

Creates a list of permuted class memberships for the time series permutation tests.

**Usage**

```r
ssPerm(df, B)
```

**Arguments**

- `df`: Data frame containing class membership and sample/patient id label.
- `B`: Number of permutations.
Value
A list of permutted class memberships

See Also
cumNorm fitTimeSeries ssFit ssPermAnalysis ssIntervalCandidate

Examples

# Not run

ssPermAnalysis

smoothing-splines anova fits for each permutation

Description
Calculates the fit for each permutation and estimates the area under the null (permutted) model for interesting time intervals of differential abundance.

Usage

ssPermAnalysis(data, formula, permList, intTimes, timePoints,
               include = c("class", "time:class"), ...)

Arguments

data Data used in estimation.
formula Formula for ssanova. Of the form: abundance ~ ... where ... includes any pData slot value.
permList A list of permutted class memberships
intTimes Interesting time intervals.
timePoints Time points to interpolate over.
include Parameters to include in prediction.
... Options for ssanova

Value
A matrix of permutted area estimates for time intervals of interest.

See Also
cumNorm fitTimeSeries ssFit ssPerm ssIntervalCandidate

Examples

# Not run
**trapz**

**Trapezoidal Integration**

**Description**

Compute the area of a function with values 'y' at the points 'x'. Function comes from the pracma package.

**Usage**

\[
\text{trapz}(x, y)
\]

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>x</td>
<td>x-coordinates of points on the x-axis</td>
</tr>
<tr>
<td>y</td>
<td>y-coordinates of function values</td>
</tr>
</tbody>
</table>

**Value**

Approximated integral of the function from 'min(x)' to 'max(x)'. Or a matrix of the same size as 'y'.

**Examples**

```r
# Calculate the area under the sine curve from 0 to pi:
n <- 101
x <- seq(0, pi, len = n)
y <- sin(x)
trapz(x, y) #=> 1.999835504

# Use a correction term at the boundary: -h^2/12\times(f'(b)-f'(a))
h <- x[2] - x[1]
ca <- (y[2]-y[1]) / h
cb <- (y[n]-y[n-1]) / h
trapz(x, y) - h^2/12 * (cb - ca) #=> 1.999999969
```

---

**ts2MRexperiment**

*With a list of fitTimeSeries results, generate an MRexperiment that can be plotted with metaviz*

**Description**

With a list of fitTimeSeries results, generate an MRexperiment that can be plotted with metaviz

**Usage**

```r
ts2MRexperiment(obj, sampleNames = NULL, sampleDescription = "timepoints", taxonomyLevels = NULL, taxonomyHierarchyRoot = "bacteria", taxonomyDescription = "taxonomy", featuresOfInterest = NULL, featureDataOfInterest = NULL)
```
uniqueFeatures

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>Output of fitMultipleTimeSeries</td>
</tr>
<tr>
<td>sampleNames</td>
<td>Sample names for plot</td>
</tr>
<tr>
<td>sampleDescription</td>
<td>Description of samples for plot axis label</td>
</tr>
<tr>
<td>taxonomyLevels</td>
<td>Feature names for plot</td>
</tr>
<tr>
<td>taxonomyHierarchyRoot</td>
<td>Root of feature hierarchy for MRexperiment</td>
</tr>
<tr>
<td>taxonomyDescription</td>
<td>Description of features for plot axis label</td>
</tr>
<tr>
<td>featuresOfInterest</td>
<td>The features to select from the fitMultipleTimeSeries output</td>
</tr>
<tr>
<td>featureDataOfInterest</td>
<td>featureData for the resulting MRexperiment</td>
</tr>
</tbody>
</table>

Value

MRexperiment that contains fitTimeSeries data, featureData, and phenoData

See Also

fitTimeSeries fitMultipleTimeSeries

Examples

data(mouseData)
res = fitMultipleTimeSeries(obj=mouseData,lvl='phylum',class="status",
                           id="mouseID",time="relativeTime",B=1)
obj = ts2MRexperiment(res)
obj

--------

uniqueFeatures Table of features unique to a group

Description

Creates a table of features, their index, number of positive samples in a group, and the number of reads in a group. Can threshold features by a minimum no. of reads or no. of samples.

Usage

uniqueFeatures(obj, cl, nsamples = 0, nreads = 0)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj</td>
<td>Either a MRexperiment object or matrix.</td>
</tr>
<tr>
<td>cl</td>
<td>A vector representing assigning samples to a group.</td>
</tr>
<tr>
<td>nsamples</td>
<td>The minimum number of positive samples.</td>
</tr>
<tr>
<td>nreads</td>
<td>The minimum number of raw reads.</td>
</tr>
</tbody>
</table>
**Description**

Settings for the `fitZig` function

**Usage**

`zigControl(tol = 1e-04, maxit = 10, verbose = TRUE, dfMethod = "modified", pvalMethod = "default")`

**Arguments**

- `tol`: The tolerance for the difference in negative log likelihood estimates for a feature to remain active.
- `maxit`: The maximum number of iterations for the expectation-maximization algorithm.
- `verbose`: Whether to display iterative step summary statistics or not.
- `dfMethod`: Either 'default' or 'modified' (by responsibilities).
- `pvalMethod`: Either 'default' or 'bootstrap'.

**Value**

The value for the tolerance, maximum no. of iterations, and the verbose warning.

**Note**

`fitZig` makes use of `zigControl`.

**See Also**

`fitZig cumNorm plotOTU`

**Examples**

```r
control = zigControl(tol=1e-10, maxit=10, verbose=FALSE)
```
