Package ‘mgsa’

May 30, 2024

Version 1.52.0
Date 2021-05-16
Title Model-based gene set analysis
Author Sebastian Bauer <mail@sebastianbauer.info>, Julien Gagneur
    <gagneur@genzentrum.lmu.de>
Maintainer Sebastian Bauer <mail@sebastianbauer.info>
Depends R (>= 2.14.0), methods, gplots
Imports graphics, stats, utils
Suggests DBI, RSQLite, GO.db, testthat
Description Model-based Gene Set Analysis (MGSA) is a Bayesian modeling approach for gene set enrichment. The package mgsa implements MGSA and tools to use MGSA together with the Gene Ontology.

Description

Model-based Gene Set Analysis (MGSA) is a Bayesian modeling approach for gene set enrichment. The package mgsa implements MGSA and tools to use MGSA together with the Gene Ontology.

alphaMcmcPost

posterior estimates of the parameter alpha for each MCMC run

Description
Posterior estimates of the parameter alpha for each MCMC run.

Usage
alphaMcmcPost(x)

## S4 method for signature 'MgsaMcmcResults'
alphaMcmcPost(x)

Arguments
x a MgsaMcmcResults.

Value
matrix: Posterior estimates of the parameter alpha for each MCMC run.

alphaPost
Posterior for alpha

Description
Realization values, posterior estimate and standard error for the parameter alpha.

Usage
alphaPost(x)

## S4 method for signature 'MgsaResults'
alphaPost(x)

Arguments
x a MgsaResults.

Value
data.frame: realization values, posterior estimate and standard error for the parameter alpha.
betaMcmcPost

Posterior estimates of the parameter beta for each MCMC run.

Usage

betaMcmcPost(x)
```
## S4 method for signature 'MgsaMcmcResults'
betaMcmcPost(x)
```

Arguments

x

a MgsaMcmcResults.

Value

matrix: Posterior estimates of the parameter beta for each MCMC run.

betaPost

Posterior for beta

Description

Realization values, posterior estimate and standard error for the parameter beta.

Usage

betaPost(x)
```
## S4 method for signature 'MgsaResults'
betaPost(x)
```

Arguments

x

a MgsaResults.

Value

data.frame: realization values, posterior estimate and standard error for the parameter beta.
createMgsaGoSets

This function takes a 1:1 mapping of go.ids to items and returns a full MgsaGOSets instance. The structure of GO is gathered from GO.db. It is sufficient to specify just the directly asserted mapping (or annotation), i.e., the most specific ones. The true path rule is taken account, that is, if an item is annotated to a term then it will be also annotated to more general terms (some people prefer to say that just the transitive closure is calculated).

Description

This function takes a 1:1 mapping of go.ids to items and returns a full MgsaGOSets instance. The structure of GO is gathered from GO.db. It is sufficient to specify just the directly asserted mapping (or annotation), i.e., the most specific ones. The true path rule is taken account, that is, if an item is annotated to a term then it will be also annotated to more general terms (some people prefer to say that just the transitive closure is calculated).

Usage

createMgsaGoSets(go.ids, items)

Arguments

- go.ids: a character vector of GO ids (GO:00001234)
- items: a vector of identifiers that are annotated to the term in the corresponding position of the go.ids vector.

Example GO sets for mgsa

This data is an example GO set for mgsa.

Example objects for mgsa

This data is an example objects for mgsa.
itemAnnotations  Item annotations of a MgsaSets

**Description**

Item annotations of a MgsaSets.

**Usage**

```r
itemAnnotations(sets, items)
```

```r
## S4 method for signature 'MgsaSets,missing'
itemAnnotations(sets, items)
```

```r
## S4 method for signature 'MgsaSets,character'
itemAnnotations(sets, items)
```

**Arguments**

- `sets` an instance of class MgsaSets.
- `items` character an optional vector specifying the items of interest.

**Value**

a data.frame: the item annotations.

itemIndices  Item indices of a MgsaSets

**Description**

Returns the indices corresponding to the items

**Usage**

```r
itemIndices(sets, items)
```

```r
## S4 method for signature 'MgsaSets,character'
itemIndices(sets, items)
```

```r
## S4 method for signature 'MgsaSets,numeric'
itemIndices(sets, items)
```
Arguments

sets an instance of class \textit{MgsaSets}.
items character or numeric the items of interest.

Value

a integer: the item indices.

---

\textit{mgsa} \hspace{1cm} \textit{Performs an MGSA analysis}

Description

Estimate marginal posterior of the MGSA problem with an MCMC sampling algorithm.
Usage

mgsa(o, sets, population = NULL, p = seq(min(0.1, 1/length(sets)), min(0.3, 20/length(sets)), length.out = 10), ...)

## S4 method for signature 'integer,list'
mgsa(o, sets, population = NULL, p = seq(1, min(20, floor(length(sets)/3)), length.out = 10)/length(sets), ...)

## S4 method for signature 'numeric,list'
mgsa(o, sets, population = NULL, p = seq(1, min(20, floor(length(sets)/3)), length.out = 10)/length(sets), ...)

## S4 method for signature 'character,list'
mgsa(o, sets, population = NULL, p = seq(1, min(20, floor(length(sets)/3)), length.out = 10)/length(sets), ...)

## S4 method for signature 'logical,list'
mgsa(o, sets, population = NULL, p = seq(min(0.1, 1/length(sets)), min(0.3, 20/length(sets)), length.out = 10), ...)

## S4 method for signature 'character,MgsaSets'
mgsa(o, sets, population = NULL, p = seq(min(0.1, 1/length(sets)), min(0.3, 20/length(sets)), length.out = 10), ...)

Arguments

- **o**: The observations. It can be a numeric, integer, character or logical. See details.
- **sets**: The sets. It can be an `MgsaSets` or a list. In this case, each list entry is a vector of type numeric, integer, character. See details.
- **population**: The total population. Optional. A numeric, integer or character vector. Default to `NULL`. See details.
- **p**: Grid of values for the parameter `p`. Values represent probabilities of term activity and therefore must be in [0,1].
- **...**: Optional arguments that are passed to the methods. Supported parameters are
  - **alpha**: Grid of values for the parameter `alpha`. Values represent probabilities of false-positive events and hence must be in [0,1]. numeric.
  - **beta**: Grid of values for the parameter `beta`. Values represent probabilities of false-negative events and hence must be in [0,1]. numeric.
  - **steps**: The number of steps of each run of the MCMC sampler. integer of length 1. A recommended value is 1e6 or greater.
  - **burnin**: The number of burn-in MCMC steps, until sample collecting begins. integer of length 1. A recommended value is half of total MCMC steps.
  - **thin**: The sample collecting period. An integer of length 1. A recommended value is 100 to reduce autocorrelation of subsequently collected samples.
flip.freq The frequency of MCMC Gibbs step that randomly flips the state of a random set from active to inactive or vice versa. numeric from (0,1].

restarts The number of different runs of the MCMC sampler. integer of length 1. Must be greater or equal to 1. A recommended value is 5 or greater.

threads The number of threads that should be used for concurrent restarts. A value of 0 means to use all available cores. Default to 0.

Details

The function can handle items (such as genes) encoded as character or integer. For convenience numeric items can also be provided but these values should essentially be integers. The type of items in the observations o, the sets and in the optional population should be consistent. In the case of character items, o and population should be of type character and sets can either be an MgsaSets or a list of character vectors. In the case of integer items, o should be of type integer, numeric (but essentially with integer values), or logical and entries in sets as well as the population should be integer. When o is logical, it is first coerced to integer with a call on which. Observations outside the population are not taken into account. If population is NULL, it is defined as the union of all sets.

The default grid value for p is such that between 1 and 20 sets are active in expectation. The lower limit is constrained to be lower than 0.1 and the upper limit lower than 0.3 independently of the total number of sets to make sure that complex solutions are penalized. Marginal posteriors of activity of each set are estimated using an MCMC sampler as described in Bauer et al., 2010. Because convergence of an MCMC sampler is difficult to assess, it is recommended to run it several times (using restarts). If variations between runs are too large (see MgsaResults), the number of steps (steps) of each MCMC run should be increased.

Value

An MgsaMcmcResults object.

References

MgsaResults, MgsaMcmcResults

Examples

```r
## observing items A and B, with sets {A,B,C} and {B,C,D}
mgsa(c("A", "B"), list(set1 = LETTERS[1:3], set2 = LETTERS[2:4]))

## same case with integer representation of the items and logical observation
mgsa(c(TRUE,TRUE,FALSE,FALSE), list(set1 = 1:3, set2 = 2:4))

## a small example with gene ontology sets and plot
```
data(example)
fit = mgsa(example_o, example_go)
## Not run:
plot(fit)
## End(Not run)

MgsaGoSets-class Gene Ontology annotations

Description

This class represents gene ontology annotations.

Details

For now, it is identical to the parental class MgsaSets.

See Also

readGAF

MgsaMcmcResults-class

Instances of this class are used to hold the additional information that was provided by running (possibly multiple times) an MCMC algorithm.

Description

Instances of this class are used to hold the additional information that was provided by running (possibly multiple times) an MCMC algorithm.

Slots

nsamples how many samples collected per MCMC run
steps how many steps per MCMC run
restarts how many MCMC runs
alphaMcmcPost posterior estimates for each MCMC run of the parameter alpha
betaMcmcPost posterior estimates for each MCMC run of the parameter beta
pMcmcPost posterior estimates for each MCMC run of the parameter p
setsMcmcPost posterior estimates for each MCMC run of the sets marginal posterior probabilities

The columns of the matrices alphaMcmcPost, betaMcmcPost, pMcmcPost and setsMcmcPost stores the posterior estimates for each individual MCMC run. The row order matches the one of the slot alphaPost, betaPost, pPots, and setsResults respectively.

Accessor methods exist for each slot.
MgsaResults-class

See Also

mgsa

MgsaResults-class  Results of an MGSA analysis

Description

The results of an MGSA analysis.

Slots

populationSize  The number of items in the population.
studySetSizeInPopulation  The number of items both in the study set and in the population.
alphaPost  with columns value, estimate and std.error.
betaPost  with columns value, estimate and std.error.
pPost  with columns value, estimate and std.error.
setsResults  with columns inPopulation, inStudySet, estimate and std.error.

The columns of the slots alphaPost, betaPost, and pPost contains a realization value, its posterior estimate and standard error for the parameters alpha, beta and p respectively.

The columns of the slot setsResults contains the number of items of the set in the population, the number of items of the set in the study set, the estimate of its marginal posterior probability and its standard error. The rownames are the names of the sets if available.

Because an MgsaResults is the outcome of an MGSA analysis (see mgsa), accessors but no replacement methods exist for each slot.

See Also

mgsa

MgsaSets-class  Sets of items and their annotations

Description

This class describes sets, items and their annotations.

Details

Internally, the method mgsa indexes all elements of the sets before fitting the model. In case mgsa must be run on several observations with the same gene sets, computations can be speeded up by performing this indexing once for all. This can be achieved by building a MgsaSets. In order to ensure consistency of the indexing, no replace method for any slot is provided. Accessors are available.

The data frames setAnnotations and itemAnnotations allow to store annotations. No constraint is imposed on the number and names of their columns.
$nsamples$

**Slots**

- *sets* A list whose elements are vector of item indices.
- *itemName2ItemIndex* The mapping of item names to index.
- *numberOfItems* How many items?
- *setAnnotations* Annotations of the sets. The *rownames* are set names.
- *itemAnnotations* Annotations of the items. The *rownames* are item names.

**See Also**

*MgsaGoSets, readGAF, mgsa*

**Examples**

```r
new("MgsaSets", sets=list(set1=c("a", "b"), set2=c("b", "c")))
```

---

<table>
<thead>
<tr>
<th>nsamples</th>
<th><em>How many samples per MCMC run collected</em></th>
</tr>
</thead>
</table>

**Description**

how many samples collected per MCMC run.

**Usage**

```r
nsamples(x)
```

```r
## S4 method for signature 'MgsaMcmcResults'
nsamples(x)
```

**Arguments**

- `x` a `MgsaMcmcResults`.

**Value**

integer: how many samples per MCMC run collected.
plot,MgsaResults-method

Plot method for MgsaResults objects

Description

Plot method for MgsaResults objects

Usage

## S4 method for signature 'MgsaResults'
plot(x, y, ...)

Arguments

x a MgsaResults
y unused
... unused

pMcmcPost posterior estimates of the parameter p for each MCMC run

Description

Posterior estimates of the parameter p for each MCMC run.

Usage

pMcmcPost(x)

## S4 method for signature 'MgsaMcmcResults'
pMcmcPost(x)

Arguments

x a MgsaMcmcResults.

Value

matrix: Posterior estimates of the parameter p for each MCMC run.
populationSize | Size of the population of a MgsaResults

**Description**

The size of the population on which the analysis was run.

**Usage**

```r
populationSize(x)
```

```r
## S4 method for signature 'MgsaResults'
populationSize(x)
```

**Arguments**

- `x` a `MgsaResults`.

**Value**

- integer: the size of the population.

---

pPost | Posterior for beta

**Description**

Realization values, posterior estimate and standard error for the parameter p.

**Usage**

```r
pPost(x)
```

```r
## S4 method for signature 'MgsaResults'
pPost(x)
```

**Arguments**

- `x` a `MgsaResults`.

**Value**

data.frame: realization values, posterior estimate and standard error for the parameter p.
**Description**

Creates a MgsaGoSets using gene ontology annotations provided by a file in GAF 1.0 or 2.0 format.

**Usage**

```r
readGAF(filename, evidence=NULL, aspect=c("P", "F", "C"))
```

**Arguments**

- `filename`: The name of the Gene Ontology annotation file. It must be in the GAF 1.0 or 2.0 format. It may be gzip-compressed.
- `evidence`: character or NULL. Only annotations with evidence code in evidence are returned. If NULL (default), annotations of all evidence codes are returned.
- `aspect`: character with values in P, C or F. Only annotations of the listed GO namespaces P (biological process), F (molecular function) or C (cellular component) are returned. By default, annotations of the three namespaces are returned.

**Details**

The function extracts from the annotation file all direct gene annotations and infers from the Gene Ontology all the indirect annotations (due to term relationships). This is done using the package `Go.db` which provides the ontology as a database and `RSQLite` for querying the database.

**Value**

An `MgsaGoSets` object.

**References**

**See Also**

`MgsaGoSets`, `mgsa`

**Examples**

```r
## parsing provided example file (yeast)
gofile = system.file("example_files/gene_association_head.sgd", package="mgsa")
readGAF(gofile)
## only annotations inferred from experiment or a direct assay
readGAF(gofile, evidence=c("EXP", "IDA"))
```
### restarts

**Description**

How many MCMC runs.

**Usage**

```r
restarts(x)
```

**Arguments**

- `x`: an `MgsaMcmcResults`.

**Value**

integer: how many MCMC runs.

---

### setAnnotations

**Description**

Set annotations of a `MgsaSets`.

**Usage**

```r
setAnnotations(sets, names)
```

**Arguments**

- `sets`: an instance of class `MgsaSets`.
- `names`: character an optional vector specifying the names of interest.

**Value**

a `data.frame`: the set annotations.
Description

Posterior estimates of the set marginal probabilities for each MCMC run.

Usage

setsMcmcPost(x)

## S4 method for signature 'MgsaMcmcResults'
setsMcmcPost(x)

Arguments

x a MgsaMcmcResults.

Value

matrix: Posterior estimates of the set marginal probabilities for each MCMC run.

setsResults

Posterior for each set

Description

Number of items of the set in the population, the number of items of the set in the study set, the estimate of its marginal posterior probability and its standard error.

Usage

setsResults(x)

## S4 method for signature 'MgsaResults'
setsResults(x)

Arguments

x a MgsaResults.

Value

data.frame: For each set, number of items of the set in the population, number of items of the set in the study set, estimate of its marginal posterior probability and standard error.
show,MgsaResults-method

Show an MgsaResults

Description
Show an MgsaResults.

Usage
## S4 method for signature 'MgsaResults'
show(object)

Arguments
object an instance of class MgsaResults.

Value
an invisible NULL

show,MgsaSets-method

Show an MgsaSets

Description
Show an MgsaSets.

Usage
## S4 method for signature 'MgsaSets'
show(object)

Arguments
object an instance of class MgsaSets.

Value
an invisible NULL
**steps**

*How many steps per MCMC run*

**Description**

how many steps per MCMC run.

**Usage**

```r
steps(x)
```

```r
## S4 method for signature 'MgsaMcmcResults'
steps(x)
```

**Arguments**

- `x`: a `MgsaMcmcResults`.

**Value**

integer: how many steps per MCMC run.

---

**studySetSizeInPopulation**

*Size of the study set of a MgsaResults*

**Description**

The size of the study set on which the analysis was run.

**Usage**

```r
studySetSizeInPopulation(x)
```

```r
## S4 method for signature 'MgsaResults'
studySetSizeInPopulation(x)
```

**Arguments**

- `x`: a `MgsaResults`.

**Value**

integer: the size of the study set.
subMgsaSets

Subset of an MgsaSets

Description

Returns a subset of an MgsaSets that contains only the specified items. Empty sets are removed.

Usage

subMgsaSets(sets, items)

## S4 method for signature 'MgsaSets,character'
subMgsaSets(sets, items)

Arguments

sets an MgsaSets.
items character. The items to restrict on.

Value

an MgsaSets.
