Package ‘ptairMS’

May 27, 2024

Title Pre-processing PTR-TOF-MS Data

Version 1.12.0

Date 2020-03-18

Description This package implements a suite of methods to preprocess data from PTR-TOF-MS instruments (HDF5 format) and generates the ‘sample by features’ table of peak intensities in addition to the sample and feature metadata (as a single ExpressionSet object for subsequent statistical analysis). This package also permit useful tools for cohorts management as analyzing data progressively, visualization tools and quality control. The steps include calibration, expiration detection, peak detection and quantification, feature alignment, missing value imputation and feature annotation. Applications to exhaled air and cell culture in headspace are described in the vignettes and examples. This package was used for data analysis of Gassin Delyle study on adults undergoing invasive mechanical ventilation in the intensive care unit due to severe COVID-19 or non-COVID-19 acute respiratory distress syndrome (ARDS), and permit to identify four potential biomarkers of the infection.

aggregate

aggregate peakgroup for align function

Description
aggregate peakgroup for align function

Usage
aggregate(subGroupPeak, n.exp)

Arguments
subGroupPeak  teh group tp aggregate
n.exp          number of expiration done in the file

Value
a matrix with the median of mz, mean of ppb, ppb in background, and percentage of expiration where the peak is detected @keywords internal

align
Alignment with kernel gaussian density

Description
Alignment with kernel gaussian density

Usage
align(peakTab, ppmGroup = 70, dmzGroup = 0.001)

Arguments
peakTab   table with comlumn : mass, quantification, and groups number to aligned
ppmGroup  width of sub group created beafore density estimation in ppm
dmzGroup  width of sub group created beafore density estimation in Da

Value
A list containing groups formed by alignment.
alignSamples

alignment between samples

Description

AlignSamples performs alignment between samples (i.e. the matching of variables between the peak lists within the ptrSet object) by using a kernel gaussian density (Delabriere et al, 2017). This function returns an ExpressionSet, which contains the matrix of peak intensities, the sample metadata (borrowed from the input ptrSet) and the variable metadata which contains the peak intensities in the background. Two filters may be applied to:

- keep only variables with a significant higher intensity in the expirations compared to the background (i.e., a p-value less than pValGreaterThres) for at least fracExp
- keep only variables which are detected in more than fracGroup percent of the samples (or group)

If you do not want to apply those filters, set fracGroup to 0 and pValGreaterThres to 1.

Usage

alignSamples(
  X,
  ppmGroup = 70,
  fracGroup = 0.8,
  group = NULL,
  fracExp = 0.3,
  pValGreaterThres = 0.001,
  pValLessThres = 0,
  quantiUnit = c("ppb", "ncps", "cps")[1],
  bgCorrected = TRUE,
  dmzGroup = 0.001
)

## S4 method for signature 'ptrSet'
alignSamples(
  X,
  ppmGroup = 70,
  fracGroup = 0.8,
  group = NULL,
  fracExp = 0.3,
  pValGreaterThres = 0.001,
  pValLessThres = 0,
  quantiUnit = c("ppb", "ncps", "cps")[1],
  bgCorrected = TRUE,
  dmzGroup = 0.001
)
Arguments

X: ptrSet already processed by the `detectPeak` function

ppmGroup: ppm maximal width for an mz group

fracGroup: only variables present in fracGroup percent of at least one group will be kept (if 0 the filter is not applied)

group: character: sampleMetadata data column name. If NULL, variables not present in fracGroup percent of samples will be deleted. Else, variables not present in fracGroup percent in at least one group will be removed.

fracExp: fraction of samples which must have their p-value less than pValGreaterThres and pValLessThres

pValGreaterThres: threshold of the p-value for the unilateral testing that quantification (in cps) of expiration points are greater than the intensities in the background.

pValLessThres: threshold of the p-value for the unilateral testing that quantification (in cps) of expiration points are less than the intensities of the background.

quantiUnit: ppb, ncps or cps

bgCorrected: logical: should the peak table contain the background corrected values?

dmzGroup: minimum mz width to be used for grouping the features (required for low masses)

Value

an `ExpressionSet` (Biobase object)

References

Delabriere et al., 2017

Examples

```r
library(ptairData)
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw,
  setName="exhaledPtrset", mzCalibRef = c(21.022, 60.0525),
  fracMaxTIC = 0.7, saveDir = NULL )
exhaledPtrset<-detectPeak(exhaledPtrset,mzNominal=c(21,60,79))
eset <- alignSamples(exhaledPtrset,pValGreaterThres=0.05)
Biobase::exprs(eset)
Biobase::fData(eset)
Biobase::pData(eset)
```
annotateVOC

Putative annotation of VOC mz by using the reference compilation from the literature

Description

Putatively annotate VOC mz by using the reference compilation from the literature, and propose an isotope detection.

Usage

annotateVOC(
  x,
  ionMassColname = "ion_mass",
  ppm = 20,
  prefix = "vocDB_",
  fields = c("ion_mass", "ion_formula", "formula", "mass_monoiso", "name_iupac",
            "pubchem_cid", "inchi", "inchikey", "ref_year", "ref_pmid", "disease_name",
            "disease_meshid") [c(1, 2, 5)]
)

## S4 method for signature 'ExpressionSet'
annotateVOC(
  x,
  ionMassColname = "ion_mass",
  ppm = 50,
  prefix = "vocDB_",
  fields = c("ion_mass", "ion_formula", "formula", "mass_monoiso", "name_iupac",
            "pubchem_cid", "inchi", "inchikey", "ref_year", "ref_pmid", "disease_name",
            "disease_meshid") [c(1, 2, 5)]
)

## S4 method for signature 'data.frame'
annotateVOC(
  x,
  ionMassColname = "ion_mass",
  ppm = 50,
  prefix = "vocDB_",
  fields = c("ion_mass", "ion_formula", "formula", "mass_monoiso", "name_iupac",
            "pubchem_cid", "inchi", "inchikey", "ref_year", "ref_pmid", "disease_name",
            "disease_meshid") [c(1, 2, 5)]
)

## S4 method for signature 'numeric'
annotateVOC(
  x,
  ionMassColname = "",

annotateVOC

ppm = 50,
prefix = "vocDB_",
fields = c("ion_mass", "ion_formula", "formula", "mass_monoiso", "name_iupac",
"pubchem_cid", "inchi", "inchikey", "ref_year", "ref_pmid", "disease_name",
"disease_meshid") [c(1, 2, 5)]

Arguments

x Expression set object (resp. data.frame) (resp. numeric vector) containing the
PTR-MS processed data (resp. containing a column with the ion mass values)
(resp. containing the ion mass values)

ionMassColname Character: column name from the fData (resp. from the data.frame) containing
the ion mass values; [default: 'ion_mass']; this argument is not used when x is
a numeric vector

ppm Numeric: tolerance

prefix Character: prefix for the new 'annotation' columns [default: 'vocDB_']

fields Character vector: fields of the 'vocDB' database to be queried among: 'ion_mass'
[default], 'ion_formula' [default], 'formula', 'mass_monoiso', 'name_iupac'
[default], 'pubchem_cid', 'inchi', 'inchikey', 'ref_year', 'ref_pmid', 'disease_name',
'disease_meshid'

Value

Returns the data.frame with additional columns containing the vocDB informations for the matched
ion_mass values as well as the detected isotopes

Examples

dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw,
setName="exhaledPtrset", mzCalibRef = c(21.022, 60.0525),
fracMaxTIC = 0.7, saveDir = NULL )
exhaledPtrset<-detectPeak(exhaledPtrset,mz=c(21,59,77))
exhaled.eset <-alignSamples(exhaledPtrset ,pValGreaterThres=0.05)
# Expression Set
exhaled.eset <- annotateVOC(exhaled.eset)
head(Biobase::fData(exhaled.eset))

# Data frame
exhaled_fdata.df <- Biobase::fData(exhaled.eset)
exhaled_fdata.df <- annotateVOC(exhaled_fdata.df)
head(exhaled_fdata.df)

# Numeric
ionMass.vn <- as.numeric(Biobase::featureNames(exhaled.eset))
annotated_ions.df <- annotateVOC(ionMass.vn)
head(annotated_ions.df)
calibration

Calibrates the mass axis with references masses

Description

To convert Time Of Flight (TOF) axis to mass axis, we use the formula: \( mz = ((tof-b)/a)^2 \) (Muller et al. 2013) To estimate those parameters, references peaks with accurate know masses and without overlapping peak are needed. The best is that the references masses covers a maximum of the mass range.

Usage

```r
 calibration(
   x,
   mzCalibRef = c(21.022, 29.013424, 41.03858, 59.049141, 75.04406, 203.943, 330.8495),
   calibrationPeriod = 60,
   tol = 70,
   ...
 )
```

## S4 method for signature 'ptrRaw'

```r
 calibration(
   x,
   mzCalibRef = c(21.022, 29.013424, 41.03858, 59.049141, 75.04406, 203.943, 330.8495),
   calibrationPeriod = 60,
   tol = 70,
   ...
 )
```

## S4 method for signature 'ptrSet'

```r
 calibration(
   x,
   mzCalibRef = c(21.022, 29.013424, 41.03858, 59.049141, 75.04406, 203.943, 330.8495),
   calibrationPeriod = 60,
   tol = 70,
   fileNames = getParameters(x)$listFile
 )
```

Arguments

- **x**
  
a ptrRaw-class or ptrSet-class object

- **mzCalibRef**
  
  Vector of accurate mass values of intensive peaks and 'unique' in a nominal mass interval (without overlapping)

- **calibrationPeriod**
  
in second, coefficient calibration are estimated for each sum spectrum of calibrationPeriod seconds

```
### calibrationFun

the maximum error tolerated in ppm. If more than tol warnings.

Value

the same ptrRaw or ptrSet as in input, with the following modified element:

- `mz`: the new mz axis calibrated
- `rawM`: same raw matrix with the new mz axis in rownames
- `calibMassRef`: reference masses used for the calibration
- `calibMzToTof` and `calibTofToMz`: function to convert TOF to mz
- `calibError`: the calibration error to the reference masses in ppm
- `calibrationIndex`: index time of each calibration period

Examples

```r
### ptrRaw object

library(ptairData)
filePath <- system.file('extdata/exhaledAir/ind1', 'ind1-1.h5', package = 'ptairData')
raw <- readRaw(filePath, calib = FALSE)
rawCalibrated <- calibration(raw)
```

---

**calibrationFun**

**calibration function**

**Description**

Performs calibration on sp with mzCalibRef reference masses and mzToTofFunc as previous calibration function

**Usage**

calibrationFun(sp, mz, mzCalibRef, calibCoef, peakShape, tol)

**Arguments**

- `sp` spectrum
- `mz` mass axis
- `mzCalibRef` masses of know reference peaks
- `calibCoef` coefficient of the previous calibration
- `peakShape` a list with reference axis and a reference peak shape centered in zero
- `tol` maximum error tolerated in ppm
**changeTimeLimits**

**Value**

list

**Description**

Shinny application to modify and view expiration limits

This function run a shiny app, where you can check the automatic expiration detection, knots location, and modify it.

**Usage**

changeTimeLimits(ptrSet)

**Arguments**

ptrSet a ptrSet object

**Value**

the ptrSet object modified

**Examples**

```r
library(ptairData)
directory <- system.file("extdata/exhaledAir", package = "ptairData")
ptrSet <- createPtrSet(directory, setName="ptrSet", mzCalibRef=c(21.022,59.049), fracMaxTIC=0.8)
## Not run: ptrSet <- changeTimeLimits(ptrSet)
```

---

**convert_to_mzML**

Convert a h5 file to mzML

**Description**

convert_to_mzML create a mzML file from a h5 file in the same directory with the writeMLData of the MSnbase package

**Usage**

convert_to_mzML(file)
createPtrSet

Arguments

file A .h5 file path

Value

create a mzML file in the same directory of the h5 input file

Examples

library(ptairData)
filePathRaw <- system.file('extdata/exhaledAir/ind1', 'ind1-1.h5', package = 'ptairData')
# write a mzml file in the same directory
convert_to_mzML(filePathRaw)
file_mzML <- gsub(".h5", "mzML", filePathRaw)
file.remove(file_mzML)

createPtrSet  Creates a ptrSet object form a directory

Description

This function creates a ptrSet-class S4 object. It opens each file and:

- performs an external calibration by using the mzCalibRef reference masses on the sum spectra every calibrationPeriod second
- quantifies the primary ion (H3O+ isotope by default) on the average total ion spectrum.
- calculates expiration on the mzBreathTracer trace. The part of the trace where the intensity is higher than fracMaxTIC * max(trace) is considered as expiration. If fracMaxTIC is different to zero, this step is skipped
- defines the set of knots for the peak analysis (see detectPeak)
- provides a default sampleMetadata based on the tree structure of the directory and the acquisition date (a data.frame with file names as row names)
- If saveDir is not NULL, the returned object will be saved as a .Rdata in saveDir with the setName as name

Usage

createPtrSet(
  dir,
  setName,
  mzCalibRef = c(21.022, 29.013424, 41.03858, 60.0525, 203.943, 330.8495),
  calibrationPeriod = 60,
  fracMaxTIC = 0.8,
  mzBreathTracer = NULL,
  knotsPeriod = 3,
createPtrSet

mzPrimaryIon = 21.022,
saveDir = NULL
)

Arguments

dir character. a directory path which contains several h5 files, possibly organized in subfolder
setName character. name of the ptrSet object. If 'saveDir' is not null, the object will be saved with this name.
mzCalibRef vector of the reference mass values; those masses should be accurate, and the corresponding peaks should be of high intensity and 'unique' in a nominal mass interval (without overlapping peaks) to performs calibration. See \?calibration.
calibrationPeriod in second, coefficient calibration are estimated for each sum spectrum of calibrationPeriod seconds
fracMaxTIC Fraction (between 0 and 1) of the maximum of the Total Ion Current (TIC) amplitude after baseline removal. Only the part of the spectrum where the TIC intensity is higher than 'fracMaxTIC * max(TIC)' will be analyzed. If you want to analyze the entire spectrum, set this parameter to 0.
mzBreathTracer integer: nominal mass of the Extracted Ion Current (EIC) used to compute the expiration time limits. If NULL, the limits will be computed on the Total Ion Current (TIC).
knotsPeriod period in second (time scale) between two knots for the two dimensional modeling
mzPrimaryIon Exact mass of the primary ion isotope
saveDir Directory where the ptrSet object will be saved as .RData. If NULL, nothing will be saved.

Value

a ptrSet object with slots :

- Parameter: list containing the parameters used for createPtrSet, detectPeak and alignTimePeriods functions.
- sampleMetadata: data frame containing information about the data, with file names in row names
- mzCalibRef: list containing for each file the masses used for the calibration (see \?ptairMS::calibration for more details)
- signalCalibRef: mz and intensity +- 0.4Da around the calibration masses
- errorCalibPpm: list containing for each file the accuracy error in ppm at each calibration masses
- coefCalib: list containing the calibration coefficients 'a' and 'b' which enable to convert tof to mz for each file (see calibration function for more details.
- resolution: estimated resolution $m/\Delta m$ for each calibration masses within each file
• TIC: The Total Ion Current for each file
• timeLimit: list containing, for each file, a list of two element: the matrix of time limit for each file (if fracMaxTIC is different to zero), and the background index. See timeLimits for more details.
• peakList: list containing for each file an expression set eSet, with m/z peak center, quantification for background and exhaled air in cps, ppb and ncp, and quantity for each time points. See getPeakList for more details.

Examples

library(ptairData)
directory <- system.file('extdata/mycobacteria', package = 'ptairData')
ptrSet<-createPtrSet(dir=directory,setName='ptrSet',
,mzCalibRef=c(21.022,59.049),
fracMaxTIC=0.9,saveDir= NULL)

cumulative_fit_function

Create cumulative function fit

Description

Create cumulative function fit

Usage

cumulative_fit_function(fit_function_str, par_var_str, par_fix_str, n.peak)

Arguments

fit_function_str
  fit function who will be use in character
par_var_str
  parameters of fit function who change with the peak in a vector of character
par_fix_str
  parameters of fit function independent of the peak in a vector of character
n.peak
  number of peak

Value

a list:
  init.names: names of paramters for the initialization
  func.eval: function who will be fitted
deadTimeCorr

**Description**

Dead time correction on raw data

**Usage**

```r
deadTimeCorr(raw, ve, vne, r, threshold = 0.1)
```

**Arguments**

- `raw`: ptrRaw object
- `ve`: extending dead time
- `vne`: non extending dead time
- `r`: number of extraction
- `threshold`: only bin of intensity more then threshold\*r which be corrected

**Value**

A ptrRaw object with the raw matrix corrected

---

defineKnots

**Define the knots location**

**Description**

defineKnots function determine the knots location for a ptrSet or ptrRaw object. There is three possibilities:

- **method = expiration** in the expiration periods, a knots is placed every `knotsPeriod` seconds, and 1 knots in the middle of two expiration, one at begin and at the end
- **method= uniforme**, the knots are placed uniformly every `knotsPeriod` time points
- **give in knotsList** a list of knot, with all base name file in name of the list element. All file must be informed. The knots location must be contained in the time axis
defineKnots

Usage

defineKnots(
  object,
  knotsPeriod = 3,
  method = c("expiration", "uniform", "manual")[1],
  knotsList = NULL,
  ...
)

## S4 method for signature 'ptrRaw'
defineKnots(
  object,
  knotsPeriod = 3,
  method = c("expiration", "uniform")[1],
  knotsList = NULL,
  timeLimit = list(NULL)
)

## S4 method for signature 'ptrSet'
defineKnots(
  object,
  knotsPeriod = 3,
  method = c("expiration", "uniform")[1],
  knotsList = NULL
)

Arguments

- **object**: ptrSet object
- **knotsPeriod**: the period in second (times scale) between two knots for the two dimensional modelization
- **method**: expiration or uniform
- **knotsList**: a list of knot location for each files, with all base name file in name of the list element
- **timeLimit**: not used

Value

- numeric vector of knots
- a list with numeric vector of knots for each file

Examples

library(ptairData)
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
...
detectPeak

mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL)

#### placed knots every 2 times points
exhaledPtrset <- defineKnots(exhaledPtrset ,knotsPeriod=2,method='uniform')

#### placed knots every 3 times points in the expiration (default)
exhaledPtrset <- defineKnots(exhaledPtrset ,knotsPeriod=3,method='expiration')

---

detectPeak Detection and quantification of peaks for a ptrSet object.

Description

The detectPeak function detects peaks on the average total spectrum around nominal masses, for all files present in ptrSet which have not already been processed. The temporal evolution of each peak is then evaluated by using a two-dimensional penalized spline regression. Finally, the expiration points (if defined in the ptrSet) are averaged, and a t-test is performed between expiration and ambient air. The peakList can be accessed with the getPeakList function, which returns the information about the detected peaks in each file as a list of ExpressionSet objects. The peak detection steps within each file are as follows:

for each nominal mass:
- correction of the calibration drift
- peak detection on the average spectrum
- estimation of temporal evolution
- t-test between expiration and ambient air

Usage

detectPeak(
  x,
  ppm = 130,
  minIntensity = 10,
  minIntensityRate = 0.01,
  mzNominal = NULL,
  resolutionRange = NULL,
  fctFit = NULL,
  smoothPenalty = NULL,
  parallelize = FALSE,
  nbCores = 2,
  saving = TRUE,
  saveDir = getParameters(x)$saveDir,
  ...
)

## S4 method for signature 'ptrRaw'
detectPeak(
x,
ppm = 130,
minIntensity = 10,
minIntensityRate = 0.01,
mzNominal = NULL,
resolutionRange = NULL,
fctFit = NULL,
smoothPenalty = NULL,
timeLimit,
knots = NULL,
mzPrimaryIon = 21.022,
...
}

## S4 method for signature 'ptrSet'
detectPeak(
  x,
  ppm = 130,
  minIntensity = 10,
  minIntensityRate = 0.01,
  mzNominal = NULL,
  resolutionRange = NULL,
  fctFit = NULL,
  smoothPenalty = 0,
  parallelize = FALSE,
  nbCores = 2,
  saving = TRUE,
  saveDir = getParameters(x)$saveDir,
  ...
)

Arguments

x an ptrSet object

ppm minimum distance in ppm between two peaks

minIntensity minimum intensity for peak detection. The final threshold for peak detection will be: max(minIntensity, threshold noise). The threshold noise corresponds to max(max(noise around the nominal mass), minIntensityRate * max(intensity within the nominal mass)

minIntensityRate Fraction of the maximum intensity to be used for noise thresholding

mzNominal nominal masses at which peaks will be detected; if NULL, all nominal masses of the mass axis

resolutionRange vector with the minimum, average, and maximum resolution of the PTR instrument. If NULL, the values are estimated by using the calibration peaks.

fctFit function for the peak quantification: should be sech2 or averagePeak. If NULL, the best function is selected by using the calibration peaks
detectPeak

smoothPenalty  second order penalty coefficient of the p-spline used for two-dimensional regression. If NULL, the coefficient is estimated by generalized cross validation (GCV) criteria

parallelize  Boolean. If TRUE, loops over files are parallelized

nbCores  number of cluster to use for parallel computation.

saving  boolean. If TRUE, the object will be saved in saveDir with the setName parameter of the createPtrSet function

saveDir  The directory where the ptrSet object will be saved as .RData. If NULL, nothing will be saved

...  may be used to pass parameters to the processFileTemporal function

timeLimit  index time of the expiration limits and background. Should be provided by timeLimits function

knots  numeric vector corresponding to the knot values, which used for the two dimensional regression for each file. Should be provided by defineKnots function

mzPrimaryIon  the exact mass of the primary ion isotope

Value

an S4 ptrSet object, that contains the input ptrSet completed with the peakLists.

determinePeakShape  

**Determine peak shape from raw data in tof**

**Description**

This function use the method describe by average and al 2013, for determine a peak shape from the raw data:

$$\text{peak}_i(\Delta_i,A_i,t_i) = \text{interpolation}(x= \text{tof}.\text{ref} \ast \Delta_i + t_i, y = A_i \ast \text{peak}.\text{ref}, \text{xout}= \text{TOF}_i)$$

where peak.ref and tof.ref are peaks reference use for mass calibration.

**Usage**

```r

determinePeakShape(raw, plotShape = FALSE)
```

**Arguments**

- `raw` a `ptrRaw-class` object
- `plotShape` if true plot each reference peak and the average peak (the peak shape)

**Value**

A list of two vectors which are the reference peak normalized tof and intensity.

---

exportSampleMetada  

**export sampleMetadata**

**Description**

export sampleMetadata

**Usage**

```r

determinePeakShape(set, saveFile)
```

**Arguments**

- `set` a `ptrSet` object
- `saveFile` a file path in tsv extension where the data.frame will be exported

**Value**

nothing
extractEIC  

**Examples**

```r
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
  mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL)
saveFile<--file.path(getwd(),'sampleMetadata.tsv')
#exportSampleMetada(exhaledPtrset ,saveFile)
```

---

**extractEIC**

*extract all raw EIC from a pre-defined peak List*

**Description**

extract all raw EIC from a pre-defined peak List

**Usage**

```r
extractEIC(raw, peak, peakQuantil = 0.01, fctFit = "sech2")
```

**Arguments**

- `raw`: ptrRaw object
- `peak`: a data.frame with a column named 'Mz'. The Mz of the VOC detected
- `peakQuantil`: the quantile of the peak shape to determine the borne of the EIC
- `fctFit`: function used to fit peak

**Value**

list containing all EIC and the mz borne for all peak

---

**fit_averagePeak**

*Fit peak with average function*

**Description**

Fit peak with average function

**Usage**

```r
fit_averagePeak(initTof, l.shape, sp, bin, lower.cons, upper.cons)
```
**Arguments**

- `initTof`: list of initialisation in tof
- `l.shape`: peak shape average
- `sp`: spectrum
- `bin`: tof axis
- `lower.cons`: lower constrain for fit
- `upper.cons`: upper constrain for fit

**Value**

list with fit information

---

**Description**

fit function average

**Usage**

`fit_averagePeak_function(t, delta, h, intervRef, peakShape, bin)`

**Arguments**

- `t`: tof center of peak
- `delta`: FWHM of peak
- `h`: peak height
- `intervRef`: reference interval for peak shape
- `peakShape`: peak shape estimated on intervalRef
- `bin`: bin interval of peak will be fitted

**Value**

peak function made on an average of reference peaks normalized
**formula2mass**  
Compute exact mass.

**Description**  
Compute exact mass from an elemental formula

**Usage**  
```r  
formula2mass(formula.vc, protonate.l = TRUE)  
```

**Arguments**  
- `formula.vc` Vector of molecular formulas.  
- `protonate.l` Should a proton be added to the formula?

**Value**  
Vector of the corresponding (protonated) masses.

**Examples**  
```r  
formula2mass("CO2")  
```

---

**getDirectory**  
get the files directory of a ptrSet

**Description**  
get the files directory of a ptrSet

**Usage**  
```r  
getDirectory(ptrSet)  
```

**Arguments**  
- `ptrSet` ptrSet object

**Value**  
the directory in absolute path as character
Examples

```r
library(ptairData)
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL )
getDirectory(exhaledPtrset )
```

getFileNames

get the file names containing in the directory of a ptrSet or ptrRaw

Description

get the file names containing in the directory of a ptrSet or ptrRaw

get the file names containing in the directory of a ptrSet

Usage

```r
getFileNames(object, fullNames = FALSE)
# S4 method for signature 'ptrSet'
getFileNames(object, fullNames = FALSE)
# S4 method for signature 'ptrRaw'
getFileNames(object, fullNames = FALSE)
```

Arguments

- `object`: ptrSet object
- `fullNames`: logical: if TRUE, it return the the directory path is prepended to the file names.

Value

a vector of character that contains all file names

Examples

```r
library(ptairData)
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL )
getFileNames(exhaledPtrset )
```
getPeakList

get the peak list of a ptrSet object

Description

get the peak list of a ptrSet object

Usage

getPeakList(set)

Arguments

set ptrSet object

Value

a list of expressionSet, where:

- assay Data contains the matrix with m/z peak center in row names, and the quantification in cps at each time point
- feature Data the matrix with m/z peak center in row names, and the following columns:
  - quanti_unit: the mean of the quantification over the expiration/headspace time limits defined
  - background_unit: the mean of the quantification over the background time limits defined
  - diffAbs_unit: the mean of the quantification over the expiration/headspace time limits defined after subtracting the baseline estimated from the background points defined
  - pValLess/ pValGreater: the p-value of the unilateral t-test, who test that quantification (in cps) of expiration points are less/greater than the intensity of the background.
  - lower/upper: integration boundaries
  - parameter peak: estimated peak parameter

Examples

library(ptairData)
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL )
exhaledPtrset<--detectPeak(exhaledPtrset,mz=c(21,59))
peakList<- getPeakList(exhaledPtrset )
X<-Biobase::exprs(peakList[[1]])
Y<- Biobase::fData(peakList[[1]])
head(Y)
### `getSampleMetadata`  
*get sampleMetadata of a ptrSet*

**Description**  
get sampleMetadata of a ptrSet

**Usage**  
```
getSampleMetadata(set)
```

**Arguments**  
- `set`  
a ptrSet object

**Value**  
a data.frame

**Examples**
```
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL)
SMD<-getSampleMetadata(exhaledPtrset)
```

### `importSampleMetadata`  
*import a sampleMetadata from a tsv file to a ptrSet object*

**Description**  
import a sampleMetadata from a tsv file to a ptrSet object

**Usage**  
```
importSampleMetadata(set, file)
```

**Arguments**  
- `set`  
a ptrSet object
- `file`  
a tsv file contains the sample metadata to import, with all file names in row name (the first column in the excel).

**Value**  
a ptrSet with the new sample metadata
**impute**

*Imputes the missing values*

**Description**

Imputes missing values by returning back to the raw data and fitting the peak shape function on the noise (or on the residuals signals if peaks have already been detected).

**Usage**

```r
impute(eSet, ptrSet, parallelize = FALSE, nbCores = 2)
```

**Arguments**

- **eSet**: ExpressionSet returned by the `alignSamples` function
- **ptrSet**: `ptrSet-class` object processed by the `detectPeak` function
- **parallelize**: boolean. If TRUE, the loop over all files will be parallelized
- **nbCores**: number of clusters to use for parallel computation.

**Value**

the same ExpressionSet as in input, with the imputed missing values in the assayData slot

**Examples**

```r
library(ptairData)
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL )
saveFile<-file.path(getwd(),'sampleMetadata.tsv')
#exportSampleMetadata(exhaledPtrset ,saveFile)
#exhaledPtrset<-importSampleMetadata(exhaledPtrset ,saveFile)
```

```r
eSet <- alignSamples(exhaledPtrset,pValGreaterThres=0.05,fracGroup=0)
Biobase::exprs(eSet)
eSet <- impute(eSet,exhaledPtrset)
Biobase::exprs(eSet)
```
**imputeMat**

Impute missing values on an matrix set from an ptrSet

**Description**

Imputing missing values by returning back to the raw data and fitting the peak shape function on the noise / residuals

**Usage**

`imputeMat(X, ptrSet, quantiUnit)`

**Arguments**

- **X**: the peak table matrix with missing values
- **ptrSet**: processed by detectPeak function
- **quantiUnit**: the unit of the quantities in the matrix X (ppb, cps or ncps)

**Value**

the same matrix as in input, with missing values imputing

**Examples**

```r
library(ptairData)
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, 
setName="exhaledPtrset", mzCalibRef = c(21.022, 60.0525), 
fracMaxTIC = 0.7, saveDir = NULL )
exhaledPtrset<-detectPeak(exhaledPtrset,mz=c(21,52))
eSet <- alignSamples(exhaledPtrset,pValGreaterThres=0.05,fracGroup=0)
X <-Biobase::exprs(eSet)
X <- imputeMat(X,exhaledPtrset,quantiUnit='ppb')
plotFeatures(exhaledPtrset,mz = 52.047,typePlot = "ggplot",colorBy = "subfolder")
```

**initializeFit**

initialization for apply fit function in the spectrum

**Description**

initialization for apply fit function in the spectrum
Usage

initializeFit(i, sp.i.fit, sp.i, mz.i, calibCoef, resmean, minpeakheight, noiseacf, ppmPeakMinSep, daSeparation, d, plotAll, c)

Arguments

i the nominal mass
sp.i.fit the vector who will be fetted (spectrum pf residual)
sp.i the spectrum around a nominal mass
mz.i the mass vector around a nominal mass
calibCoef calibration coefficient
resmean resolution m/delta(m) mean
minpeakheight the minimum peak intensity
noiseacf aytocorelation of the noise
ppmPeakMinSep the minimum distance between two peeks in ppm
daSeparation the minimum distance between two peeks in da
d the degree of savitzky golay filter
plotAll bollean if TRUE, it plot all the initialiation step
c the number of current itteration

Value

a list with fit input
LocalMaximaSG  
*Find local maxima with Savitzky Golay filter*

**Description**

Apply Savitzky Golay filter to the spectrum and find local maxima such that: second derivate Savitzky Golay filter \( < 0 \) and first derivate \( = 0 \) and intensity \( > \) minPeakHeight

**Usage**

\[
\text{LocalMaximaSG}(\text{sp}, \text{minPeakHeight} = -\infty, \text{noiseacf} = 0.1, \text{d} = 3)
\]

**Arguments**

- **sp**: the array of spectrum values
- **minPeakHeight**: minimum intensity of a peak
- **noiseacf**: autocorrelation of the noise
- **d**: the degree of Savitzky Golay filter, default 3

**Value**

array with peak’s index in the spectrum

**Examples**

```r
spectrum<-dnorm(x=seq(-5,5,length.out = 100))
index.max<-LocalMaximaSG(spectrum)
```

makeSubGroup  
*Use in align function. return a peak group thanks to kernel gaussian density in a peak matrix.*

**Description**

Use in align function. return a peak group thanks to kernel gaussian density in a peak matrix.

**Usage**

\[
\text{makeSubGroup}(\text{subpeakl}, \text{den}, \text{plim})
\]

**Arguments**

- **subpeakl**: a matrix with mz, ppb, background and group column.
- **den**: the kernel gaussian density estimated on subpeakl
- **plim**: the limit of a peak in the density of the group who will be fromed
Value

the sub peakgroup

---

OptimalWindowsSG

Find optimal window’s size for Savitzky Golay filter

Description

Find optimal window’s size for Savitzky Golay filter

Usage

OptimalWindowsSG(sp, noiseacf, d = 3)

Arguments

- `sp`: the array of spectrum values
- `noiseacf`: autocorrelation of the noise
- `d`: the degree of Savitzky Golay filter

Value

the optimal size of Savitzky Golay filter’s windows

---

PeakList

Detection and quantification of peaks on a sum spectrum.

Description

Detection and quantification of peaks on a sum spectrum.

Usage

PeakList(
  raw,
  mzNominal = unique(round(getRawInfo(raw)$mz)),
  ppm = 130,
  resolutionRange = c(3000, 5000, 8000),
  minIntensity = 5,
  fctFit = c("sech2", "averagePeak")[1],
  peakShape = NULL,
  maxIter = 1,
  R2min = 0.995,
  autocorNoiseMax = 0.3,
  plotFinal = FALSE,
plotAll = FALSE,
thNoiseRate = 1.1,
minIntensityRate = 0.01,
countFacFWHM = 10,
daSeparation = 0.005,
d = 3,
WindowSize = 0.4
)

## S4 method for signature 'ptrRaw'
PeakList(
  raw,
mzNominal = unique(round(getRawInfo(raw)$mz)),
ppm = 130,
resolutionRange = c(300, 5000, 8000),
minIntensity = 5,
fctFit = c("sech2", "averagePeak")[1],
peakShape = NULL,
maxIter = 3,
R2min = 0.995,
autocorNoiseMax = 0.3,
plotFinal = FALSE,
plotAll = FALSE,
thNoiseRate = 1.1,
minIntensityRate = 0.01,
countFacFWHM = 10,
daSeparation = 0.005,
d = 3,
WindowSize = 0.4
)

Arguments

raw           ptrRaw-class object
mzNominal     the vector of nominal mass where peaks will be detected
ppm           the minimum distance between two peaks in ppm
resolutionRange vector with resolution min, resolution Mean, and resolution max of the PTR
minIntensity  the minimum intensity for peaks detection. The final threshold for peak detection will be: max (minPeakDetect, thresholdNoise). The threshold-Noise correspond to max(thNoiseRate * max(noise around the nominal mass), minIntensityRate * max(intensity in the nominal mass)). The noise around the nominal mass correspond: [m-windowSize-0.2,m-windowSize]U[m+windowSize,m+WindowSize+0.2]
fctFit        the function for the quantification of Peak, should be average or Sech2
peakShape     a list with reference axis and a reference peak shape centered in zero
maxIter       maximum iteration of residual analysis
R2min         R2 minimum to stop the iterative residual analysis
the autocorrelation threshold for Optimal windows Savitzky Golay filter in \texttt{OptimalWindowSG} function. See \texttt{OptimalWindowSG}.

- \texttt{plotFinal} boolean. If TRUE, plot the spectrum for all nominal masses, with the final fitted peaks.
- \texttt{plotAll} boolean. If TRUE, plot all steps to get the final fitted peaks.
- \texttt{thNoiseRate} The rate which multiplies the max noise intensity.
- \texttt{minIntensityRate} The rate which multiplies the max signal intensity.
- \texttt{countFacFWHM} integer. We will sum the fitted peaks on a window’s size of \texttt{countFacFWHM} * FWHM, centered in the mass peak center.
- \texttt{daSeparation} the minimum distance between two peaks in Da for nominal mass < 17.
- \texttt{d} the degree for the Savitzky Golay filter.
- \texttt{windowSize} peaks will be detected only around \texttt{m - windowSize} ; \texttt{m + windowSize}, for all \texttt{m} in \texttt{mZNominal}.

**Value**

a list containing:

- \texttt{peak}: a data.frame, with for all peak detected: the mass center, the intensity count in cps, the peak width (\texttt{delta_mz}), correspond to the Full Width Half Maximum (FWHM), the resolution \texttt{m/delta_m}, the other parameters values estimated of \texttt{fitFunc}.
- \texttt{warnings}: warnings generated by the peak detection algorithm per nominal masses.
- \texttt{infoPlot}: elements needed to plot the fitted peak per nominal masses.

**Examples**

```r
library(ptairData)
filePath <- system.file('extdata/exhaledAir/ind1', 'ind1-1.h5', package = 'ptairData')
file <- readRaw(filePath)

peakList <- PeakList(file, mzNominal = c(21,63))
peakList$peak
```

---

**plot.ptrSet, ANY-method**

*Plot a ptrSet object*

**Description**

plot a ptrSet object
## Usage

```r
## S4 method for signature 'ptrSet,ANY'
plot(x, y, typePlot = "")
```

### Arguments

- **x**: a ptrSet object
- **y**: not use
- **typePlot**: could be: calibError, resolution, peakShape, or a empty character if you want all.

### Value

- plot

### Examples

```r
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL )
plot(exhaledPtrset )
plot(exhaledPtrset ,typePlot='calibError')
plot(exhaledPtrset ,typePlot='resolution')
plot(exhaledPtrset ,typePlot='peakShape')
```

---

### plotCalib

*Plot the calibration peaks after calibration*

## Description

Plot the calibration peaks after calibration

## Usage

```r
plotCalib(object, ppm = 2000, ...)
```

```r
## S4 method for signature 'ptrRaw'
plotCalib(object, ppm = 2000, ...)
```

```r
## S4 method for signature 'ptrSet'
plotCalib(object, ppm = 2000, pdfFile = NULL, fileNames = NULL, ...)
```
**plotFeatures**

**Arguments**

- `object`: a ptrSet or ptrRaw object
- `ppm`: the width of plot windows
- `pdfFile`: is different of `NULL`, the file path to save the plots in pdf
- `fileNames`: the name of the files in the ptrSet object to plot. If `NULL`, all files will be plotted

**Value**

`plot`

**Examples**

```r
## ptrSet
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL )
plotCalib(exhaledPtrset ,fileNames=getFileNames(exhaledPtrset )[1])

## ptrRaw
filePath<-system.file('extdata/exhaledAir/ind1/ind1-1.h5',
package = 'ptairData')
raw <- readRaw(filePath,mzCalibRef=c(21.022,59.049))
plotCalib(raw)
```

---

**plotFeatures**

*Plot raw average spectrum around a mzRange*

**Description**

Plot the raw data spectrum for several files in a ptrSet object around the mz masses. The expiration average spectrum is in full lines, and background in dashed lines.

**Usage**

```r
plotFeatures(
    set,
    mz,
    typePlot = "plotly",
    addFeatureLine = TRUE,
    ppm = 2000,
    pdfFile = NULL,
    fileNames = NULL,
    colorBy = "rownames"
)
```
## S4 method for signature 'ptrSet'
plotFeatures(
  set,
  mz,
  typePlot = "plotly",
  addFeatureLine = TRUE,
  ppm = 2000,
  pdfFile = NULL,
  fileNames = NULL,
  colorBy = "rownames"
)

### Arguments
- set: a ptrSet-class object
- mz: the mz values to plot
- typePlot: set "plotly" to get an interactive plot, or "ggplot"
- addFeatureLine: boolean. If TRUE a vertical line at the mz masses is plotted
- ppm: windows size of the plot round mz in ppm
- pdfFile: a file path to save a pdf with a individual plot per file
- fileNames: vector of character. The file names you want to plot. If NULL, it plot all files
- colorBy: character. A column name of sample metadata by which the line are colored.

### Value
- a plotly or ggplot2 object

### Examples
```r
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw,
  setName="exhaledPtrset", mzCalibRef = c(21.022, 60.0525),
  fracMaxTIC = 0.7, saveDir = NULL )
plotF<-plotFeatures(exhaledPtrset ,mz=59.049,type="ggplot",colorBy="subfolder")
print(plotF)
```

---

### S4 method for signature 'ptrSet'
plotPeakShape

```r
plotPeakShape
plot the average peak shape of reference calibration masses for a ptrSet
```

### Description
- plot the average peak shape of reference calibration masses for a ptrSet

### Usage
```r
plotPeakShape(set, showAverage = FALSE)
```
Arguments

set   ptrSet object
showAverage   boolean

Value

ggplot object

Description
Displays the image of the matrix of intensities, the TIC and the TIS, for the selected m/z and time ranges

Usage

plotRaw(
  object,
  mzRange, 
  timeRange = c(NA, NA),
  type = c("classical", "plotly")[1],
  ppm = 2000,
  palette = c("heat", "revHeat", "grey", "revGrey", "ramp")[1],
  showVocDB = TRUE,
  figure.pdf = "interactive",
  ...
)

## S4 method for signature 'ptrRaw'
plotRaw(
  object,
  mzRange, 
  timeRange = c(NA, NA),
  type = c("classical", "plotly")[1],
  ppm = 2000,
  palette = c("heat", "revHeat", "grey", "revGrey", "ramp")[1],
  showVocDB = TRUE,
  figure.pdf = "interactive",
  ...
)

## S4 method for signature 'ptrSet'
plotRaw(
  object,
  ...
mzRange,
  timeRange = c(NA, NA),
  type = c("classical", "plotly")[1],
  ppm = 2000,
  palette = c("heat", "revHeat", "grey", "revGrey", "ramp")[1],
  showVocDB = TRUE,
  figure.pdf = "interactive",
  fileNames = NULL,
  ...
)

Arguments

object An S4 object of class ptrRaw-class or ptrSet
mzRange Either a vector of 2 numerics indicating the m/z limits or an integer giving a
nominal m/z
timeRange Vector of 2 numerics giving the time limits
type Character: plot type; either 'classical' [default] or 'plotly'
ppm Integer: Half size of the m/z window when mzRange is set to a nominal mass
palette Character: Color palette for the 'classical' plot; either 'heat' [default], 'revHeat',
'grey', 'revGrey' or 'ramp'
showVocDB Logical: Should putative m/z annotations from the internal package database be
displayed (default is TRUE)
figure.pdf Character: Either 'interactive' [default], or the filename of the figure to be saved
(with the 'pdf' extension); only available for the 'classical' display
... not used
fileNames vector of character. The file names of the ptrSer that you want to plot. Could be
in basename or full name.

Value

Invisibly returns a list of the raw (sub)matrix 'rawsubM' and the voc (sub)database 'vocsubDB'

Examples

dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL )
ptairMS::plotRaw(exhaledPtrset ,mzRange=59,fileNames='ind1-1.h5')

patientRaw <- ptairMS::readRaw(system.file("extdata/exhaledAir/ind1/ind1-1.h5",
package = 'ptairData'), mzCalibRef=c(21.022,59.049,75.05))
ptairMS::plotRaw(patientRaw, mzRange = 59)
ptairMS::plotRaw(patientRaw, mzRange = 59, type = 'plotly')
plotTIC

plot the Total Ion spectrum (TIC) for one or several files.

Description

plot the Total Ion spectrum (TIC) for one or several files.

Usage

plotTIC(
  object,
  type = c("plotly", "ggplot")[1],
  baselineRm = FALSE,
  showLimits = FALSE,
  ...
)

## S4 method for signature 'ptrRaw'
plotTIC(object, type, baselineRm, showLimits, fracMaxTIC = 0.8, ...)

## S4 method for signature 'ptrSet'
plotTIC(
  object,
  type,
  baselineRm,
  showLimits,
  pdfFile = NULL,
  fileNames = NULL,
  colorBy = "rownames",
  normalizePrimariIon = FALSE,
  ...
)

Arguments

object ptrSet or ptrRaw S4 object

 type set 'plotly' to get an interactive plot, and 'ggplot' for classical plot.

baselineRm logical. If TRUE, remove the baseline of the TIC

showLimits logical. If TRUE, add the time limits to the TIC

fracMaxTIC Percentage (between 0 and 1) of the maximum of the Total Ion Current (TIC) amplitude with baseline removal. We will analyze only the part of the spectrum where the TIC intensity is higher than fracMaxTIC * max(TIC). If you want to analyze the entire spectrum, set this parameter to 0.
ptrRaw-class

PTR-TOF-MS raw data from a rhdf5 file

Description

A ptrRaw object contains PTR-TOF-MS raw data from one rhdf5 file. It is created with the `readRaw` function.

Slots

- `name` the file name
- `rawM` the raw intensities matrix
- `mz` array of the m/z axis
- `time` numeric vector of acquisition time (in seconds)
- `calibMzToTof` function to convert m/z to Tof
- `calibTofToMz` function to convert tof to m/z
- `calibCoef` calibration coefficients (a,b) such that: \( \text{mz} = ((\text{tof} - b)/a)^2 \) for each calibration period
- `indexTimeCalib` index time of each calibration period

pdfFile a absolute file path. A pdf will be generated with a plot for each file, caints TIC and time limits.

fileNames vector of character. The file names of the ptrSer that you want to plot. Could be in basename or fullname.

colorBy character. A name of the ptrSet's sampleMetaData column, to display with the same color files of same attributes.

normalizePrimariIon should the TIC be normalized by the primary ion

Value

a plotly of ggplot2 object.

Examples

```r
### ptrRaw object

library(ptairData)
filePath <- system.file('extdata/exhaledAir/ind1', 'ind1-1.h5', package = 'ptairData')
raw <- readRaw(filePath)
p <- plotTIC(raw)

dirRaw <- system.file('extdata/exhaledAir', package = 'ptairData')
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL)
plotTIC(exhaledPtrset ,type='ggplot')
```
ptrSet-class

A set of PTR-TOF-MS raw data informations

Description

A ptrSet object is related to a directory that contains several PTR-TOF-MS raw data in rhdf5 format. It is created with the createPtrSet function. This object could be updated when new files are added with the updatePtrSet function.

Slots

parameter the input parameters value of the function createPtrSet and detectPeak
sampleMetadata dataframe of sample metadata, with file names in row names, suborders names and acquisition date in columns
date acquisition date for each file
mzCalibRef the masses used for calibration for each file
signalCalibRef the spectrum of mass calibration for each file
errorCalibPpm the calibration error for each file
coeaFcalib the coefficients of mass axis calibration of each calibration periods for each file
indexTimeCalib index time of each calibration period for each file
primaryIon the quantity in count per acquisition time of the isotope of primary ion for each file
resolution estimation of the resolution for each file based on the calibration reference masses
prtReaction drift information (temperature, pressure and voltage)
ptrTransmision transmission curve for each file

References

https://www.hdfgroup.org
TIC  the total ion current (TIC) for each file  
breathTracer  the tracer for expiration/head spaces detection  
timeLimit  the index of time limit for each file  
knots  numeric vector correspond to the knot that will be used for the two dimensional regression for each file  
fctFit  the peak function used for peak deconvolution for each file  
peakShape  average normalized peak shape of the calibration peak for each file  
peakList  individual peak list in eSet

---

**readRaw**

Read a h5 file of PTR-TOF-MS data

---

**Description**

*readRaw* reads a h5 file with rhdf5 library, and calibrates the mass axis with *mZCalibRef* masses each *calibrationPeriod* seconds. It returns a *ptrRaw-class* S4 object, that contains raw data.

**Usage**

```r
readRaw(
  filePath,
  calib = TRUE,
  mzCalibRef = c(21.022, 29.013424, 41.03858, 60.0525, 203.943, 330.8495),
  calibrationPeriod = 60,
  tolCalibPpm = 70,
  maxTimePoint = 900
)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filePath</td>
<td>h5 absolute file path full name.</td>
</tr>
<tr>
<td>calib</td>
<td>boolean. If true, an external calibration is performed on the calibrationPeriod sum spectrum with <em>mZCalibRef</em> reference masses.</td>
</tr>
<tr>
<td>mzCalibRef</td>
<td>calibration parameter. Vector of exact theoretical masses values of an intensive peak without overlapping.</td>
</tr>
<tr>
<td>calibrationPeriod</td>
<td>in second, coefficient calibration are estimated for each sum spectrum of calibrationPeriod seconds</td>
</tr>
<tr>
<td>tolCalibPpm</td>
<td>calibration parameter. The maximum error tolerated in ppm. A warning appears for error greater than tolCalibPpm.</td>
</tr>
<tr>
<td>maxTimePoint</td>
<td>number maximal of time point to read</td>
</tr>
</tbody>
</table>
resetSampleMetadata

Value

a ptrRaw object, including slot

- rawM the data raw matrix, in count of ions
- mz the mz axis
- time time acquisition in second

Examples

library(ptairData)
filePathRaw <- system.file('extdata/exhaledAir/ind1', 'ind1-1.h5',
package = 'ptairData')
raw <- readRaw(filePath=filePathRaw, mzCalibRef=c(21.022, 60.0525), calib=FALSE)

resetSampleMetadata(ptrset)

Description

reset the default sampleMetadata, containing the suborders names and the acquisition dates as columns.

Usage

resetSampleMetadata(ptrset)

Arguments

ptrset a ptrser object

Value

a data.frame

Examples

dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL )
SMD<- resetSampleMetadata(exhaledPtrset)
**rmPeakList**  
*remove the peakList of an ptrSet object*

**Description**

This function is useful when you want to change the parameters of the detect peak function. First delete the peakList with `rmPeakList`, and apply `detectPeak` with the new parameters.

**Usage**

```r
rmPeakList(object)
```

**Arguments**

- `object` ptrSet object

**Value**

a ptrSet

**Examples**

```r
library(ptairData)
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset", 
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL )
exhaledPtrset <-rmPeakList(exhaledPtrset )
```

---

**RunShinnyApp**  
*Graphical interface of ptairMS workflow*

**Description**

The whole workflow of ptairMS can be run interactively through a graphical user interface, which provides visualizations (expiration phases, peaks in the raw data, peak table, individual VOCs), quality controls (calibration, resolution, peak shape and evolution of reagent ions depending on time), and exploratory data analysis.

**Usage**

```r
RunShinnyApp()
```

**Value**

Shinny app
setSampleMetadata

Examples

## Not run: RunShinnyApp()

---

### Description

Insert a sample metadata data.frame in a ptrSet object. The dataframe must have all file names in rownames.

### Usage

```
setSampleMetadata(set, sampleMetadata)
```

### Arguments

- **set**: a ptrSet object
- **sampleMetadata**: a data.frame with all file names of the ptrSet in row names

### Value

The ptrSet object in argument with the sampleMetadata modified

### Examples

```
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset", 
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL )
SMD <- getSampleMetadata(exhaledPtrset)
colnames(SMD)[1]<-'individual'
exhaledPtrset<-setSampleMetadata(exhaledPtrset ,SMD)
```

---

### Description

It indicates the files, the mz range, time acquisition range, and calibration error.

### Usage

```
## S4 method for signature 'ptrRaw'
show(object)
```
Arguments

object  a ptrRaw object

Value

nothing

---

show,ptrSet-method  show a ptrSet object

---

Description

It indicates the directory, the number of files that contain the directory at the moment, and the number of processed files. The two numbers are different, use `updatePtrSet` function.

Usage

```r
## S4 method for signature 'ptrSet'
show(object)
```

Arguments

object  a ptrSet object

Value

nothing

---

snipBase  Baseline estimation

---

Description

Baseline estimation

Usage

```r
snipBase(sp, widthI = 11, iteI = 5)
```

Arguments

sp  an array with spectrum values
widthI  width of interval
iteI  number of iteration

Value

baseline estimation of the spectrum
timeLimits  
Calculates time limits on the breath tracer

Description

This function derives limits on the breath tracer indicated, where the intensity is greater than fracMaxTIC*max(tracer). By setting fracMaxTIC close to 1, the size of the limits will be restricted. This function also determines the index corresponding to the background, where variation between two successive point can be controlled with derivThreshold parameter.

Usage

timeLimits(
  object,
  fracMaxTIC = 0.5,
  fracMaxTICBg = 0.2,
  derivThresholdExp = 1,
  derivThresholdBg = 0.05,
  mzBreathTracer = NULL,
  minPoints = 2,
  degreeBaseline = 1,
  baseline = TRUE,
  redefineKnots = TRUE,
  plotDel = FALSE
)

## S4 method for signature 'ptrRaw'

timeLimits(
  object,
  fracMaxTIC = 0.6,
  fracMaxTICBg = 0.2,
  derivThresholdExp = 0.5,
  derivThresholdBg = 0.05,
  mzBreathTracer = NULL,
  minPoints = 2,
  degreeBaseline = 1,
  baseline = TRUE,
  redefineKnots = TRUE,
  plotDel = FALSE
)

## S4 method for signature 'ptrSet'

timeLimits(
  object,
  fracMaxTIC = 0.5,
  fracMaxTICBg = 0.2,
  derivThresholdExp = 1,
derivThresholdBg = 0.05,  
minPoints = 2,  
degreeBaseline = 1,  
baseline = TRUE,  
redefineKnots = TRUE,  
plotDel = FALSE  
)

Arguments

object           a ptrRaw or ptrSet object
fracMaxTIC       between 0 and 1. Percentage of the maximum of the tracer amplitude with 
                 baseline removal. If you want a finer limitation, increase fracMaxTIC, indeed 
fracMaxTICBg      same as fracMaxTIC but for background detection (lower than fracMaxTIC*max(TIC)) 
derivThresholdExp the threshold of the difference between two successive points of the expiration 
derivThresholdBg  the threshold of the difference between two successive points of the background 
mzBreathTracer   NULL or a integer. Correspond to a nominal masses of Extract Ion Current 
                 (EIC) whose limits you want to compute. If NULL, the limits are calculated on 
                 the Total Ion Current (TIC). 
minPoints         minimum duration of an expiration (in index).
degreeBaseline   the degree of polynomial baseline function 
baseline          logical, should the trace be baseline corrected? 
redefineKnots     logical, should the knot location must be redefined with the new times limits ? 
plotDel           boolean. If TRUE, the trace is plotted with limits and threshold.

Value

a list with expiration limits (a matrix of index, where each column correspond to one expiration, the 
first row it is the beginning and the second the end, or NA if no limits are detected) and index of the 
background.

Examples

## ptrRaw object

```r
library(ptairData)
filePath <- system.file('extdata/exhaledAir/ind1', 'ind1-1.h5', 
package = 'ptairData')
raw <- readRaw(filePath)

timLim <- timeLimits(raw, fracMaxTIC=0.9, plotDel=TRUE)
timLim_acetone <- timeLimits(raw, fracMaxTIC=0.5, mzBreathTracer = 59, 
plotDel=TRUE)
```
**TransmissionCurve**

### Estimation of the transmission curve

#### Description

Estimation of the transmission curve

#### Usage

TransmissionCurve(x, y)

#### Arguments

- **x**: masses
- **y**: transmission data

#### Value

A numeric vector

---

**updatePtrSet**

### update a ptrSet object

#### Description

When new files are added to a directory which has already a ptrSet object associated, run updatePtrSet to add the new files in the object. The information on the new files are added to the object with the same parameter used for the function createPtrSet who has created the object. updatePtrSet also delete from the ptrSet deleted files in the directory.

#### Usage

updatePtrSet(ptrset)

#### Arguments

- **ptrset**: a ptrset object

#### Value

The same ptrset object than input, but completed with new files and without deleted files in the directory
Examples

```r
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL )
# add or delete files in the directory
# exhaledPtrset<- updatePtrSet(exhaledPtrset)
```

width

*Calculate the FWHM (Full Width at Half Maximum) in raw data*

Description

Calculate the FWHM (Full Width at Half Maximum) in raw data

Usage

```r
width(tof, peak, fracMaxTIC = 0.5)
```

Arguments

- **tof**: A vector of tof interval
- **peak**: A vector of peak Intensity
- **fracMaxTIC**: the fraction of the maximum intenisty to compute the width

Value

the delta FWHM in tof

writeEset

*Exporting an ExpressionSet instance into 3 tabulated files 'dataMatrix.tsv', sampleMetadata.tsv', and 'variableMetadata.tsv'*

Description

Note that the dataMatrix is transposed before export (e.g., the samples are written column wise in the 'dataMatrix.tsv' exported file).

Usage

```r
writeEset(x, dirName, overwrite = FALSE, verbose = TRUE)
```

## S4 method for signature 'ExpressionSet'
writeEset(x, dirName, overwrite = FALSE, verbose = TRUE)
writeEset

Arguments

  x          An S4 object of class ExpressionSet
  dirName    Character: directory where the tables should be written
  overwrite  Logical: should existing files be overwritten?
  verbose    Logical: should messages be printed?

Value

No object returned.

Examples

library(ptairData)
dirRaw <- system.file("extdata/exhaledAir", package = "ptairData")
exhaledPtrset <- createPtrSet(dir=dirRaw, setName="exhaledPtrset",
mzCalibRef = c(21.022, 60.0525), fracMaxTIC = 0.7, saveDir = NULL )
exhaledPtrset<-detectPeak(exhaledPtrset,mz=c(21,59,77))
eset <- ptairMS::alignSamples(exhaledPtrset )
writeEset(eset, dirName = file.path(getwd(), "processed_dataset"))
unlink(file.path(getwd(), "processed_dataset"),recursive = TRUE)
