Package ‘rBiopaxParser’

April 4, 2024

Type Package
Title Parses BioPax files and represents them in R
Version 2.42.0
Date 2020-07-14
Author Frank Kramer
Maintainer Frank Kramer <frank.kramer@informatik.uni-augsburg.de>
Description Parses BioPAX files and represents them in R, at the moment BioPAX level 2 and level 3 are supported.
License GPL (>= 2)
Depends R (>= 4.0), data.table
Imports XML
Suggests Rgraphviz, RCurl, graph, RUnit, BiocGenerics, RBGL, igraph
URL https://github.com/frankkramer-lab/rBiopaxParser
biocViews DataRepresentation
RoxygenNote 7.1.1

## Description

Parses BioPax files and represents them in R

## Details

rBiopaxParser is a...

```
Package: rBiopaxParser
Type: Package
Version: 0.15
Date: 2012-08-22
License: GPL (>= 2)
```

## Author(s)

Frank Kramer <dev@frankkramer.de>
Examples

```r
## Not run: biopax = readBiopax(file="biopaxmodel.owl")
```

Description

This function adds a new biochemical reaction to the biopax model. This is a convenience function, internally the function addBiopaxInstance is called with properties LEFT and RIGHT set.

Usage

```r
addBiochemicalReaction(biopax, LEFT = c(), RIGHT = c(), id = NULL)
```

Arguments

- `biopax`: A biopax model
- `LEFT`: vector of strings. IDs of the physicalEntityParticipant instances that are on the left side of this reaction.
- `RIGHT`: vector of strings. IDs of the physicalEntityParticipant instances that are on the right side of this reaction.
- `id`: string. ID for the control. If NULL a new ID is generated with prefix "biochemicalReaction".

Value

Returns the biopax model with the added pathway.

Author(s)

fkramer

Examples

```r
biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id_1")
biopax$dt
```
addBiopaxInstance

This function adds a new instance to an existing Biopax model.

**Description**

This function adds a new instance to an existing Biopax model. "properties" is a named list of vectors, with the vector name as the name of the property and every entry of the vector a property value. Please note: case sensitivity! In Biopax Level 2 all properties are written in all capital letters. This will change in Biopax Level 3.

**Usage**

```r
addBiopaxInstance(
  biopax,  
  class,  
  id,  
  properties = list(NAME = c()),  
  verbose = TRUE  
)
```

**Arguments**

- `biopax`: A Biopax model
- `class`: string. Class name
- `id`: string. ID of the instance
- `properties`: named list of properties.
- `verbose`: logical. Be verbose about what was added.

**Value**

Returns the supplied Biopax model with the new instance added.

**Author(s)**

Frank Kramer

**Examples**

```r
biopax = createBiopax(level=2)
biopax = addBiopaxInstance(biopax, class="protein", id="id1", properties=list(NAME="protein1",SYNONYMS="p1"))
biopax$dt
```
addBiopaxInstances  

This function adds new instances to an existing biopax model.

Description

This function adds new instances (supplied as a compatible data.table) to an existing biopax model via rbind. Usually you want to start out at createBiopax and addPhysicalEntity and work your way up the ontology ladder.

Usage

addBiopaxInstances(biopax, newInstancesDF)

Arguments

biopax  A biopax model
newInstancesDF  data.table or data.frame. Must be compatible with internal biopax implementation.

Value

Returns the supplied biopax model with the new instances added.

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
biopax_temp = createBiopax(level=2)
biopax_temp = addBiopaxInstance(biopax_temp, class="protein", id="id1", properties=list(NAME="protein1",SYNONYM="p1"))
selectInstances(biopax_temp)
biopax = addBiopaxInstances(biopax, selectInstances(biopax_temp))

addControl  

This function adds a new control to the biopax model.

Description

This function adds a new interaction of class control to the biopax model. This is a convenience function to add controls, internally the function addBiopaxInstance is called with properties CONTROL-TYPE, CONTROLLER and CONTROLLED set.
**addControl**

Usage

```r
caller = c("ACTIVATION", "INHIBITION"),
controller = "",
controlled = c(),
id = NULL
)
```

Arguments

**biopax**  
A biopax model

**CONTROL_TYPE**  
string. Specifies whether this is an activating or inhibiting control.

**CONTROLLER**  
string. ID of the physicalEntityParticipant instance that is the controller of this interaction.

**CONTROLLED**  
vector of strings. IDs of the interaction and/or pathway instances that are being controlled.

**id**  
string. ID for the control. If NULL a new ID is generated with prefix "control".

Value

Returns the biopax model with the added pathway.

Author(s)

fkramer

Examples

```r
biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id_1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id3", NAME="controllerProtein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id3", id="PEP_p_id3")
biopax = addControl(biopax, CONTROL_TYPE="ACTIVATION", CONTROLLER="PEP_p_id3", CONTROLLED="biochem_id_1", id="c_
```

```r
biopax$dt
```
addhash

Description
Add a hash in front of a string

Usage
addhash(x)

Arguments
x
A string to be preceded by a hash

Value
The supplied string with a hash "#" pasted in front of it.

Author(s)
Frank Kramer

addns

Description
Add a namespace tag to the supplied classname string

Usage
addns(classname, namespace = "bp")

Arguments
classname
A string containing a classname
namespace
A string containing a namespace

Value
If the classname is not preceded by a namespace yet, the supplied namespace is pasted in front of it and returned.

Author(s)
Frank Kramer
addPathway

This function adds a new pathway to the biopax model.

Description
This function adds a new pathway + its PATHWAY-COMPONENTS (references to interaction/pathways/pathwaySteps)

Usage
addPathway(
  biopax,
  NAME,
  PATHWAY_COMPONENTS = c(),
  id = NULL,
  ORGANISM = NULL,
  COMMENT = NULL
)

Arguments
biopax A biopax model
NAME string. Name of the pathway
PATHWAY_COMPONENTS character vector. IDs of the pathway components. This must be IDs of instances of type interaction/pathway/pathwayStep (or their subclasses).
id string. ID for the pathway. If NULL a new ID is generated with prefix "pathway".
ORGANISM string. Organism property of the pathway. optional.
COMMENT string. An optional comment

Value
Returns the biopax model with the added pathway.

Author(s)
fkramer

Examples
biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id_1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id3", NAME="controllerProtein1")
addPathwayComponents

This function adds pathway components to an existing pathway

Description

This function adds pathway components to an existing pathway. Property PATHWAY-COMPONENTS are references to IDs of interaction/pathways/pathwaySteps (or subclasses of those).

Usage

```
addPathwayComponents(biopax, id, PATHWAY_COMPONENTS = c())
```

Arguments

- `biopax` A biopax model
- `id` string. ID for the pathway
- `PATHWAY_COMPONENTS` character vector. IDs of the pathway components. This must be IDs of instances of type interaction/pathway/pathwayStep (or their subclasses).

Value

Returns the biopax model with the pathway components added to the pathway

Author(s)

fkramer

Examples

```
biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id_1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id3", NAME="controllerProtein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id3", id="PEP_p_id3")
biopax = addControl(biopax, CONTROL_TYPE="ACTIVATION", CONTROLLER="PEP_p_id3", CONTROLLED="biochem_id_1", id="c_id1")
biopax = addPathway(biopax, NAME="mypathway1", PATHWAY_COMPONENTS=c("c_id1"), id="pw_id1")
biopax = addPathwayComponents(biopax, id="pw_id1", PATHWAY_COMPONENTS=c("c_id1"))
biopax$dt
```
addPhysicalEntity *This function adds a new physical entity.*

Description

This function adds a new physical entity of chosen class to the biopax model. This is a convenience function to add physical entities, internally the function addBiopaxInstance is called with properties NAME and ORGANISM set.

Usage

```r
addPhysicalEntity(
  biopax,
  class = c("dna", "rna", "protein", "smallMolecule", "complex")[1],
  NAME,
  id = NULL,
  ORGANISM = NULL,
  COMMENT = NULL
)
```

Arguments

- **biopax** A biopax model
- **class** string. Class of the physical entity to add, choose from c("dna", "rna", "protein", "smallMolecule", "complex").
- **NAME** string. Name of the new physical entity
- **id** string. ID for the physical entity. If NULL a new ID is generated with prefix "physicalEntity".
- **ORGANISM** string. Organism property of the molecule. optional.
- **COMMENT** string. An optional comment

Value

Returns the biopax model with the added physical entity.

Author(s)

fkramer

Examples

```r
biopax = createBiopax(level=2)
biopax = addBiopaxInstance(biopax, class="protein", id="id1", properties=list(NAME="protein1",COMMENT="this is my first protein!"))
biopax$dt
biopax = addPhysicalEntity(biopax, class="protein", id="id2", NAME="protein2", COMMENT="This is a protein added using the convenience function addPhysicalEntity")
biopax$dt
```
addPhysicalEntityParticipant

This function adds a new physical entity participant.

Description

This function adds a new physical entity participant instance, which is a placeholder for physicalEntity class instances in interactions. This is a convenience function to add physicalEntityParticipant instances, internally the function addBiopaxInstance is called.

Usage

addPhysicalEntityParticipant(biopax, referencedPhysicalEntityID, id = NULL)

Arguments

biopax A biopax model
referencedPhysicalEntityID string. ID the new physicalEntity instance to reference here.
id string. ID for the physical entity participant. If NULL a new ID is generated with prefix "physicalEntityParticipant".

Value

Returns the biopax model with the added physicalEntityParticipant.

Author(s)

fkramer

Examples

biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id1")
biopax$dt
This function adds new properties to an existing biopax instance.

**Usage**

```r
addPropertiesToBiopaxInstance(biopax, id, properties)
```

**Arguments**

- `biopax`: A biopax model
- `id`: string. ID of the instance
- `properties`: named list of properties.

**Value**

Returns the supplied biopax model with new properties added to this instance.

**Examples**

```r
biopax = createBiopax(level=2)
biopax = addBiopaxInstance(biopax, class="protein", id="id1", properties=list(NAME="protein1",SYNONYMS="p1"))
biopax$dt
biopax = addPropertiesToBiopaxInstance(biopax, id="id1", properties=list(COMMENT="this is my first protein!"))
biopax$dt
```

**Description**

A dataset containing two regulatory pathways encoded in Biopax Level 2 and parsed in via readBiopax().

Another dataset containing pathways encoded in Biopax Level 2 and parsed in via readBiopax().
Format

An example biopax model parsed in via readBiopax.
An example biopax model parsed in via readBiopax.

Examples

data(biopaxexample)
biopax
data(biopaxLevel3Example)
biopax

calcGraphOverlap

This function calculates the overlap of 2 graphs

Description

This function calculates the overlap of supplied graph1 with graph2. Layout and weights of graph1 are kept.

Usage

calcGraphOverlap(graph1, graph2)

Arguments

graph1 graphNEL
graph2 graphNEL

Value

Returns a list containing the compared graphs and edge- and node-wise overlap between them.

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
pvid1 = "pid_p_100002_wntpathway"
pvid2 = "pid_p_100146_hespathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pvid1)
mygraph2 = pathway2RegulatoryGraph(biopax, pvid2)
calcGraphOverlap(mygraph1, mygraph2)
checkValidity

This function checks the supplied biopax model for validity.

Description
This function checks the supplied biopax model for validity, concerning classes, properties, etc. Not yet implemented. Called internally by writeBiopax.

Usage
checkValidity(biopax)

Arguments
biopax A biopax model

Value
logical. Returns TRUE is the biopax model is valid Biopax Level 2, or FALSE otherwise.

Author(s)
Frank Kramer

CLASS_INHERITANCE_BP2

Description
Class inheritance relationships in Biopax Level 2.

Usage
CLASS_INHERITANCE_BP2

Format
A data frame with 46 rows and 2 columns

Details
A data.frame listing all direct superclasses for every Biopax Level 2 class. The variables are as follows:

- class. Name of the class
- superclass. Name of the superclass
CLASS_INHERITANCE_BP3

Description

Class inheritance relationships in Biopax Level 3.

Usage

CLASS_INHERITANCE_BP3

Format

A data frame with 46 rows and 2 columns

Details

A data.frame listing all direct superclasses for every Biopax Level 3 class. The variables are as follows:

- class. Name of the class
- superclass. Name of the superclass

NOT UPDATED TO BP3 yet!

CLASS_PROPERTIES_BP2

Description

Class properties in Biopax Level 2.

Usage

CLASS_PROPERTIES_BP2

Format

A data frame with 106 rows and 4 columns
Details

A data.frame listing all direct properties for every Biopax Level 2 class. Together with CLASS_INHERITANCE_BP2 this allows to list all properties, including the inherited ones, of every class.

The variables are as follows:

- **class.** Name of the class
- **property.** Name of the superclass
- **property_type.** Type of the property, value or reference
- **cardinality.** Maximum allowed cardinality of a property. Many properties may only be singular.

---

Description

Class properties in Biopax Level 3.

Usage

CLASS_PROPERTIES_BP3

Format

A data frame with 106 rows and 4 columns

Details

A data.frame listing all direct properties for every Biopax Level 3 class. Together with CLASS_INHERITANCE_BP3 this allows to list all properties, including the inherited ones, of every class.

The variables are as follows:

- **class.** Name of the class
- **property.** Name of the superclass
- **property_type.** Type of the property, value or reference
- **cardinality.** Maximum allowed cardinality of a property. Many properties may only be singular.
colorGraphNodes

This function colors the nodes of a graph.

Description

This function colors nodes of a graph, usually this is used to color subgraphs or add a color hue correlating with the expression level or fold change to the molecules.

Usage

colorGraphNodes(graph1, nodes, values, colors = c("greenred", "yellowred"))

Arguments

graph1
graphNEL

nodes
vector of node names specifying which nodes to color. must be same length as parameter foldChanges

values
vector of values indicating fold changes, gene expression values or similar. colors are mapped linearly over the range of these values

colors
string. either "greenred" or "yellowred", specifying which color gradient to use.

Value

Returns a graph with specified nodes colored according to the foldChanges

Author(s)

Frank Kramer

Examples

# load data and retrieve wnt pathway
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph1 = layoutRegulatoryGraph(mygraph1)
# retrieve all nodes
nodes = nodes(mygraph1)
# random expression data for your nodes
values = rnorm(length(nodes), mean=6, sd=2)
# color nodes of the graph
mygraph1 = colorGraphNodes(mygraph1, nodes, values, colors="greenred")
# plot the now colored graph
plotRegulatoryGraph(mygraph1, layoutGraph=FALSE)
**combineNodes**

This function gracefully combines nodes of a regulatory graph.

**Description**

This gracefully combines nodes from a regulatory graph. This is basically a wrapper for graph::combineNodes(nodes, graph, newName, collapseFunction=max). If there are duplicated edges for the nodes, the maximum edgeweight will be used for the new connection.

**Usage**

```r
combineNodes(nodes, graph, newName)
```

**Arguments**

- `nodes`: vector of node names specifying which nodes to combine.
- `graph`: graphNEL
- `newName`: string. Name of the newly created node that will combine the specified nodes.

**Value**

Returns a graph with specified nodes removed.

**Author(s)**

Frank Kramer

**Examples**

```r
# load data and retrieve wnt pathway
data(biopaxexample)
```

---

**createBiopax**

This function creates a new Biopax model from scratch.

**Description**

This function creates a new Biopax model from scratch. This is not necessary if you want to parse a BioPAX export from a file, please see: readBiopax. Returns a biopax model, which is a list with named elements:

- `df`: The data.frame representing the biopax in R
- `ns_rdf`: RDF Namespace
- `ns_owl`: OWL Namespace
- `ns_bp`: Biopax Namespace
- `file`: NULL
Usage
createBiopax(level = 3)

Arguments
level integer. Specifies the BioPAX level.

Value
A biopax model

Author(s)
Frank Kramer

Examples
biopax = createBiopax(level=2)

Description
Databases available for direct download via downloadBiopaxData

Usage
DATABASE_BIOPAX

Format
A data frame with 46 rows and 4 columns

Details
A data.frame listing all available databases which can be directly downloaded (Homo Sapiens only) via function downloadBiopaxData. The variables are as follows:

• database. Name of the database
• model. Name of the ontology model
• version. Biopax level
• link. Link to the direct download
This function returns the different nodes and edges between graph1 and graph2.

Description

This function returns the different nodes and edges between graph1 and graph2. Layout options of graph1 are kept. Coloring currently not implemented.

Usage

diffGraphs(graph1, graph2, colorNodes = TRUE, colors = c("#B3E2CD", "#FDCDAC"))

Arguments

graph1         graphNEL
graph2         graphNEL
colorNodes     logical
colors         character vector of colors. If colorNodes==TRUE these colors are used for graph1 and graph2 respectively.

Value

Return the diff between the graphs.

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph2 = pathway2RegulatoryGraph(biopax, pwid2)
plotRegulatoryGraph(diffGraphs(mygraph1,mygraph2))
downloadBiopaxData  

This function downloads Biopax data from online databases

Description

This function has an internal list of download links for some online databases. It will retrieve the selected model from the selected database using RCurl. The downloaded file is (if needed) unzipped and ready to be used as input for rBiopaxParser::readBiopax. This function requires package RCurl to run. You can easily skip this step by downloading the exported file yourself and continuing with readBiopax.

Usage

```r
downloadBiopaxData(
  database = "NCI",
  model = c("pid", "biocarta", "reactome", "kegg"),
  outputfile = "",
  version = "biopax2"
)
```

Arguments

- **database**  
  string. Select which database you want to download from. Currently only NCI links have been stored.

- **model**  
  string. Select which model/file you want to download. Currently NCI versions of the Pathway Interaction Database, Biocarta, Reactome and KEGG are linked.

- **outputfile**  
  string. The file name to save the downloaded data in. If left empty the URL file name will be used. The unzipped file name can be different from this. Check the screen output of gunzip.

- **version**  
  string. Select which Biopax Version you want to download.

Value

none. Check output for the name of the unzipped biopax .owl file.

Author(s)

fkramer

Examples

```r
## Not run: file = downloadBiopaxData("NCI", "biocarta", version = "biopax2")
## Not run: biopax = readBiopax(file)
## Not run: biopax
```
**generateNewUniqueID**

This function generates a new unique id for a biopax model.

**Description**

This function generates a new unique id for a biopax model. Pass it an starting point like "pathway" or "protein" to get a niceer looking id.

**Usage**

```r
generateNewUniqueID(biopax, id = "")
```

**Arguments**

- `biopax`: A biopax model
- `id`: string. This is used as a prefix for the id.

**Value**

Returns an unused unique ID.

**Author(s)**

fkramer

---

**getClassProperties**

This function returns the properties of the supplied biopax class.

**Description**

This function returns the properties of the supplied biopax class. It always considers inheritance. Every class inherits the properties of its super classes. A table listing all available properties and their cardinalities (for Biopax Level 2).

**Usage**

```r
getClassProperties(classname, biopaxlevel = 3)
```

**Arguments**

- `classname`: A string containing a class name
- `biopaxlevel`: Numeric. Specifies the Biopax Level to use.

**Value**

Returns a data.frame containing the properties and cardinalities of the supplied class.
getInstanceClass

This function returns the class name of the instance.

**Description**

This function returns the class name of the instance.

**Usage**

getInstanceClass(biopax, id)

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>biopax</td>
<td>A biopax model</td>
</tr>
<tr>
<td>id</td>
<td>string</td>
</tr>
</tbody>
</table>

**Value**

Returns the class name of the biopax instance.

**Author(s)**

Frank Kramer

**Examples**

```r
# load data
data(biopaxexample)
getInstanceClass(biopax, id="ex_m_100650")
```
getInstanceProperty  

This function returns all properties of the specified type for an instance.

Description

This function returns all properties of the specified type for an instance. By default this function returns the NAME property of an instance.

Usage

getInstanceProperty(
  biopax,
  id,
  property = "NAME",
  includeAllNames = TRUE,
  biopaxlevel = 3
)

Arguments

biopax  
A biopax model

id  
string

property  
string.

includeAllNames  
logical. Biopax Level 3 brought 2 new name properties: displayName and standardName. Per default this return all names of an instance. Disable if you only want the NAME property.

biopaxlevel  
integer. Set the biopax level here if you supply a data.table directly.

Value

Returns a character vector with all properties of the selected type for this instance. Returns NULL if no property data is found.

Author(s)

fkramer

Examples

# load data
data(biopaxexample)
getInstanceProperty(biopax, id="ex_m_100650", property="NAME")
getInstanceProperty(biopax, id="ex_m_100650", property="ORGANISM")
getInstanceProperty(biopax, id="ex_m_100650", property="COMPONENTS")
getNeighborhood

*This function returns the neighborhood of a physicalEntity*

**Description**

This function searches the supplied biopax for interactions that are connected to the molecule or within 'depth' number of steps from it.

**Usage**

```r
getNeighborhood(biopax, id, depth = 1, onlyInPathways = c(), biopaxlevel = 3)
```

**Arguments**

- `biopax`: A biopax model
- `id`: string. ID of a physicalEntity (dna, rna, protein, complex, smallMolecule)
- `depth`: integer. Search depth, this specifies how far out from the specified molecule the neighborhood should be stretched.
- `onlyInPathways`: character vector of pathway IDs. Search only in these pathways for neighbors.
- `biopaxlevel`: integer. Set the biopax level here if you supply a data.table directly.

**Value**

Returns ids of interactions within 'depth' number of steps of the specified physicalEntity

**Author(s)**

fkramer

getParticipants

*This function is used internally by pathway2Graph to obtain physical entities participating in an interaction.*

**Description**

This function is used internally by pathway2Graph to obtain physical entities participating in an interaction.

**Usage**

```r
getParticipants(
  pwComponentList,
  instance,
  biopaxlevel,
  splitComplexMolecules = FALSE,
  useIDsasNodenames = TRUE
)
```
getReferencedIDs

Arguments

pwComponentList
List of pathway components

instance
Biopax instance id

biopaxlevel
integer. Set the biopax level here if you supply a data.table directly.

splitComplexMolecules
logical. If TRUE complexes are split up into their components and the annotation of the components is added.

useIDasNodenames
logical. If TRUE nodes of the graph are named by their molecule IDs instead of using the NAME property. This can help with badly annotated/formatted databases.

Author(s)

Nirupama Benis

getReferencedIDs
This function returns a vector of ids of all instances referenced by the specified instance.

Description

This function takes an id and a biopax model as input. The id of every instance that is referenced is returned. If recursive == TRUE this function recurses through all referenced IDs of the referenced instances and so on. "onlyFollowProperties" limits the recursivness to only certain properties, for example follow only complexes or physical Entities.

Usage

getReferencedIDs(biopax, id, recursive = TRUE, onlyFollowProperties = c())

Arguments

biopax
A biopax model OR a compatible data.table

id
string. ID of the instance

recursive
logical

onlyFollowProperties
character vector

Value

Returns a character vector of IDs referenced by the supplied id in the supplied biopax model.
Author(s)
Frank Kramer

Examples

# load data
data(biopaxexample)
listComplexComponents(biopax, id="ex_m_100650")
getReferencedIDs(biopax, id="ex_m_100650", recursive=FALSE)
getReferencingIDs(biopax, id="ex_m_100650", recursive=TRUE)

getReferencingIDs

This function returns a vector of ids of all instances that reference the supplied id.

Description

This function takes an id and a biopax model as input. The id of every instance that references the supplied id is returned. If recursive == TRUE this function recurses through all referencing IDs of the referencing instances and so on. "onlyFollowProperties" limits the recursivness to only certain properties, for example follow only complexes or physicalEntities.

Usage

getReferencingIDs(biopax, id, recursive = TRUE, onlyFollowProperties = c())

Arguments

biopax A biopax model
id string. ID of the instance
recursive logical
onlyFollowProperties character vector

Value

Returns a character vector of IDs referencing the supplied id in the supplied biopax model.

Author(s)
Frank Kramer

Examples

# load data
data(biopaxexample)
listComplexComponents(biopax, id="ex_m_100650")
getReferencedIDs(biopax, id="ex_m_100650", recursive=FALSE)
getReferencingIDs(biopax, id="ex_m_100650", recursive=TRUE)
### getSubClasses

This function returns the subclasses of the supplied biopax class.

#### Description

This function returns the subclasses of the supplied biopax class.

#### Usage

```r
getSubClasses(classname, biopaxlevel = 3)
```

#### Arguments

- `classname`: A string containing a class name
- `biopaxlevel`: Numeric. Specifies the Biopax Level to use.

#### Value

Returns character vector containing the subclasses of the supplied class

#### Author(s)

Frank Kramer

#### Examples

```r
getSubClasses("control")
```

### getSuperClasses

This function returns the superclasses of the supplied biopax class.

#### Description

This function returns the superclasses of the supplied biopax class.

#### Usage

```r
getSuperClasses(classname, biopaxlevel = 3)
```

#### Arguments

- `classname`: A string containing a class name
- `biopaxlevel`: Numeric. Specifies the Biopax Level to use.
getXrefAnnotations

Value

Returns character vector containing the superclasses of the supplied class

Author(s)

Frank Kramer

Examples

getSuperClasses("control")

getXrefAnnotations This function returns the annotations of the supplied instances.

Description

This function returns the annotations of the supplied IDs in a data.table.

Usage

getcxrefAnnotations(
  biopax,
  id,
  splitComplexes = FALSE,
  followPhysicalEntityParticipants = TRUE,
  biopaxlevel = 3
)

Arguments

biopax A biopax model
id vector of strings. IDs of instances to get annotations
splitComplexes logical. If TRUE complexes are split into their components and the annotation of the components is added.
followPhysicalEntityParticipants logical. If TRUE physicalEntityParticipants are resolved to their corresponding physicalEntities and their annotation is added.
biopaxlevel integer. Set the biopax level here if you supply a data.table directly.

Value

Returns data.table with annotations

Author(s)

fkramer
hasProperty

Examples

# load data
data(biopaxexample)

# example of annotation for a protein:
getXrefAnnotations(biopax, id="ex_m_100647")

# no annotations for exactly the complex
getXrefAnnotations(biopax, id="ex_m_100650")

# split up the complex and get annotations for all the molecules involved
getXrefAnnotations(biopax, id="ex_m_100650", splitComplexes=TRUE)

hasProperty Checks if instances in the biopax data.table have a given property

Description

Checks if instances in the biopax data.table have a given property

Usage

hasProperty(df, property)

Arguments

df A data.frame with biopax instances
property A string containing the name of the property to check for

Value

Returns TRUE for every row in the data.frame with contains the supplied property. Logical vector with length corresponding to the number of rows in the data.frame.

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
internal_checkArguments

This function checks the supplied arguments if they abide to the given restrictions

Description

This function checks the supplied arguments if they abide to the given restrictions

Usage

internal_checkArguments(
  args = c(),
  allowedValues = list(),
  allowNULL = FALSE,
  allowNA = FALSE,
  allowEmptyString = TRUE,
  allowInf = TRUE
)

Arguments

args  The vector of arguments to check
allowedValues  A named list of values the argument of a this name is allowed to have
allowNULL  Logical, allow NULL or not
allowNA  Logical, allow NA or not
allowEmptyString  Logical, allow empty strings or not
allowInf  Logical, allow values of +/- infinity or not

Value

Returns 1 if all checks completed successfully, returns error message otherwise.

Author(s)

Frank Kramer
**internal_generateXMLfromBiopax**

*This function generates the xmlTree from the supplied biopax model.*

**Description**

This function is used internally by writeBiopax. It can also be called directly with a fitting dataframe in list(df=data.frame()), but this will probably break things.

**Usage**

```r
internal_generateXMLfromBiopax(biopax, namespaces = namespaces, verbose = TRUE)
```

**Arguments**

- `biopax` A biopax model
- `namespaces` A list of namespaces to use for the generated XML/RDF file
- `verbose` logical

**Value**

Returns the xmlTree generated from the supplied biopax model.

**Author(s)**

Frank Kramer

**internal_getBiopaxModelAsDataFrame**

*This internal function parses the Biopax XML of the supplied biopax model and returns it in the data.frame format.*

**Description**

This internal function parses the Biopax XML of the supplied biopax model and returns it in the data.frame format.

**Usage**

```r
internal_getBiopaxModelAsDataFrame(biopax, biopaxxml, verbose = TRUE)
```

**Arguments**

- `biopax` A biopax object
- `biopaxxml` Biopax XML file read in. See parseBiopax
- `verbose` logical
**internal_propertyListToDF**

**Value**

Returns the parsed biopax model in the internal data.frame format.

**Author(s)**

Frank Kramer

---

**internal_NrOfXMLNodes**

*This function is an internal function to count the Number of nodes and child nodes of an XMLNode.*

**Description**

This function is an internal function to count the Number of nodes and child nodes of an XMLNode.

**Usage**

`internal_NrOfXMLNodes(myXMLNode)`

**Arguments**

- `myXMLNode` XMLNode to analyze

**Value**

This function returns the number of Nodes and child Nodes an XMLNode has.

**Author(s)**

Frank Kramer

---

**internal_propertyListToDF**

*Internal function to build a data.frame from the list of properties for a new instance*

**Description**

Internal function to build a data.frame from the list of properties for a new instance
Usage

```r
internal_propertyListToDF(
  class,
  id,
  properties,
  namespace_rdf = "rdf",
  biopaxlevel = 2
)
```

Arguments

- `class`: string. Class name
- `id`: string. ID of the instance
- `properties`: named list of properties.
- `namespace_rdf`: string. This defines the rdf namespace to use.
- `biopaxlevel`: integer. This sets the version of BioPAX to generate, level 2 and level 3 are supported at the moment.

Value

Returns a data.frame with the new properties for the given instance

Author(s)

Frank Kramer

---

### internal_resolvePhysicalEntityParticipant

This function resolves physicalEntityParticipantIDs to their corresponding physicalEntityIDs

Usage

```r
internal_resolvePhysicalEntityParticipant(biopax, physicalEntityId)
```

Arguments

- `biopax`: A biopax model
- `physicalEntityId`: string. IDs of physicalEntityParticipants to be resolved

Description

This function resolves physicalEntityParticipantIDs to their corresponding physicalEntityIDs. Every physicalEntityParticipant corresponds exactly to one physicalEntity.
Value

Returns ids of physicalEntity corresponding to the specified physicalEntityParticipantIDs

Author(s)

fkramer

internal/XMLInstance2DF

This function is an internal function that parses a Biopax XMLNode.

Description

This function is an internal function that parses a Biopax XMLNode. Do not call it manually.

Usage

internal/XMLInstance2DF(myXMLNode, namespace_rdf, ret, rowcount)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>myXMLNode</td>
<td>XMLNode</td>
</tr>
<tr>
<td>namespace_rdf</td>
<td>String specifying the namespace to use for rdf:resource and rdf:datatype</td>
</tr>
<tr>
<td>ret</td>
<td>data.table object containing the already parsed data to attach this instance to</td>
</tr>
<tr>
<td>rowcount</td>
<td>Numeric specifying the row at which further parsed data is inserted into the data.table</td>
</tr>
</tbody>
</table>

Value

Returns a list containing the new rowcount and the instance id of the added instance

Author(s)

Frank Kramer
**intersectGraphs**

This function returns a graph computed by the intersection of supplied graph1 and graph2.

**Description**

This function returns a graph computed by the intersection of supplied graph1 and graph2. Layout and weights of graph1 are kept.

**Usage**

intersectGraphs(graph1, graph2)

**Arguments**

- **graph1**: graphNEL
- **graph2**: graphNEL

**Value**

Returns the intersection of graph1 and graph2.

**Author(s)**

Frank Kramer

**Examples**

```r
# load data
data(bioxpathexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph2 = pathway2RegulatoryGraph(biopax, pwid2)
plotRegulatoryGraph(intersectGraphs(mygraph1,mygraph2))
```

---

**isOfClass**

Checks if instances in the biopax data.table are of the given class

**Description**

This function checks if instances in the supplied biopax data.table are of a given class. If considerInheritance is set to TRUE it also checks if instances are of a given class or any of its inherited classes.
Usage

isOfClass(df, class, considerInheritance = FALSE, biopaxlevel = 2)

Arguments

df A data.frame with biopax instances
class A string containing the class name to check for
considerInheritance Logical value indicating whether to consider inheritance or not
biopaxlevel Numeric. Specifies the Biopax Level to use.

Value

Returns TRUE for every row in the data.frame which is of the supplied class

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)

isOfNamespace

Check if a classname is preceeded by a certain namespace tag like in "namespace:classname"

Description

This function checks if the supplied input string starts with a supplied namespace tag

Usage

isOfNamespace(classname, namespace = "bp")

Arguments

classname A string containing the class name to check
namespace A string giving the namespace to check for

Value

This function returns TRUE if the supplied classname string is preceeded with the supplied namespace string, and FALSE if not.

Author(s)

Frank Kramer
isURL

Description
This function checks if the supplied input string starts with "http:"

Usage
isURL(string)

Arguments
string A string containing the classname to check

Value
This function returns TRUE if the supplied classname string starts with "http:", and FALSE if not.

Author(s)
Frank Kramer

layoutRegulatoryGraph

This function generates a (more or less) beautiful layout for a regulatory graph.

Description
This function generates a (more or less) beautiful layout for a regulatory graph. Call this after you generated a graph with pathway2RegulatoryGraph. Since beauty is always in the eye of the beholder consider this a starting point for making your graphs even nicer. Rgraphviz with dot layout is used. Edges are green/red with normal/tee arrowheads for activations/inhibitions. If you want to specifically paint subgraphs in different colors use lists of vectors with node names for parameter subgraphs and vector of color names for subgraphs.color for your choice of color. The output can be further tweaked by setting layout options using nodeRenderInfo(mygraph) <- list() ... See the Rgraphviz and Graphviz documentations.

Usage
layoutRegulatoryGraph(
  mygraph,
  label = "",
  node.fixedsize = FALSE,
  edge.weights = c("green", "black", "red"),
  edge.arrowheads = c("normal", "tee"),
)
subgraphs = list(),
subgraphs.colors = c("#B3E2CD", "#FDCDAC", "#F4CAE4", "#E6F5C9", "#FFF2AE")
)

Arguments

mygraph    graphNEL
label      Label of the graph
node.fixedsize logical. If font size is fixed or variable in regards to the nodes.
edge.weights vector. which colors to use for weighted edges
d安庆e.arrowheads vector. which arrowheads to use for weighted edges
subgraphs   A list of character vectors with node names defining the sub graphs.
subgraphs.colors vector. which colors to use for subgraphs

Value

Returns the supplied graph in a layouted form with several parameters set for regulatory graph plotting.

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespahpathway"
mygraph = pathway2RegulatoryGraph(biopax, pwid1)
mygraph = layoutRegulatoryGraph(mygraph)
plotRegulatoryGraph(mygraph)

listComplexComponents  This function lists all components of a given complex.

Description

This function returns a (unique) data.frame listing all component IDs, names and classes of the supplied complex.

Usage

listComplexComponents(biopax, id, returnIDonly = FALSE, biopaxlevel = 3)
listInstances

Arguments

- biopax: A biopax model
- id: string. A complex ID
- returnIDonly: logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
- biopaxlevel: integer. Set the biopax level here if you supply a data.table directly.

Value

data.frame

Author(s)

Frank Kramer

Examples

```r
# load data
data(biopaxexample)
listComplexComponents(biopax, id="ex_m_100650")
```

Description

Lists all instances that conform to the selection criteria. In contrast to selectInstances this function returns an easier to read list. This function returns an ordered data.table of class, id and name of the instances. Selection criteria are whether instances belong to a certain class or have the specified id or name. Setting a criteria to NULL ignores this criteria. If includeSubClasses is set to TRUE the class criteria is broadened to include all classes that inherit from the given class, e.g. if class="control" and includeSubClasses=TRUE the function will select catalyses and modulations too, since they are a subclass of class control.

Usage

```r
listInstances(
  biopax,
  id = NULL,
  class = NULL,
  name = NULL,
  includeSubClasses = FALSE,
  returnIDonly = FALSE,
  biopaxlevel = 3
)
```
listInteractionComponents

**Arguments**

- `biopax`: A biopax model
- `id`: string. ID of the instances to select
- `class`: string. Class of the instances to select
- `name`: string. Name of the instances to select
- `includeSubClasses`: logical. If `includeSubClasses` is set to TRUE the class criteria is broadened to include all classes that inherit from the given class
- `returnIDonly`: logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
- `biopaxlevel`: integer. Set the biopax level here if you supply a data.table directly.

**Value**

Returns a data.frame containing all instances conforming to the given selection criteria. If `returnIDonly=TRUE`, only the selector for the internal data.table otherwise.

**Author(s)**

Frank Kramer

**Examples**

```r
# load data
data(biopaxexample)
# list all instances of class "protein"
listInstances(biopax, class="protein")
# list all instances of class "pathway"
listInstances(biopax, class="pathway")
# list all interaction including all subclasses of interactions
listInstances(biopax, class="interaction", includeSubClasses=TRUE)
```

**Description**

This function lists all components of a given interaction.
listPathwayComponents

Usage

listInteractionComponents(
    biopax,
    id,
    splitComplexes = TRUE,
    returnIDonly = FALSE,
    biopaxlevel = 3
)

Arguments

biopax A biopax model
id string. A complex ID
splitComplexes logical. If TRUE complexes are split up into their components and the added to the listing.
returnIDonly logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
biopaxlevel integer. Set the biopax level here if you supply a data.table directly.

Value
data.frame

Author(s)
Frank Kramer

Examples

# load data
data(biopaxexample)
listInteractionComponents(biopax, id="ex_i_100036_activator_1")

listPathwayComponents This function lists all pathway components of a given pathway.

Description

This function returns a (unique) data.frame listing all component IDs, names and classes of the supplied pathway.
Usage

listPathwayComponents(
  biopax,
  id,
  includeSubPathways = TRUE,
  returnIDOnly = FALSE,
  biopaxlevel = 3
)

Arguments

biopax A biopax model
id string. A pathway ID
includeSubPathways logical. If TRUE the returned list will include subpathways and pathwaysteps as well.
returnIDOnly logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
biopaxlevel integer. Set the biopax level here if you supply a data.table directly.

Value
data.frame

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
listPathwayComponents(biopax, id="pid_p_100002_wntpathway")

listPathways

This function returns a list of all pathway ids.

Description

This function returns a vector of all pathway ids.

Usage

listPathways(biopax, biopaxlevel = 3)
Arguments

- **biopax**: A biopax model
- **biopaxlevel**: integer. Set the biopax level here if you supply a data.table directly.

Value

Returns a character vector containing the names of all pathways.

Author(s)

Frank Kramer

Examples

```r
# load data
data(biopaxexample)
listPathways(biopax)
```

mergePathways

*This function merges two given pathways*

Description

This function merges two given pathways and appends it to the supplied biopax model. The user has to specify a new name for the pathways and can supply ID, ORGANISM and COMMENT properties for the new pathway. If no ID is supplied, a new unique ID is generated. If no organism property is supplied the organism property of the first pathway is re-used. If ORGANISM is NULL the property is not set. Optionally a comment can be added to the pathway.

Usage

```r
mergePathways(
  biopax,
  pwid1,
  pwid2,
  NAME,
  id = NULL,
  ORGANISM = "",
  COMMENT = NULL,
)
```

Arguments

- **biopax**: A biopax model
- **pwid1**: string. ID of first pathway to merge
- **pwid2**: string. ID of second pathway to merge
NAME string. Name of the new merged pathway
id string. ID for the pathway. If NULL a new ID is generated with prefix "pathway".
ORGANISM string. Organism property of the pathway. By default uses the same organism as the first supplied pathway. If NULL no organism property is set.
COMMENT string. An optional comment

Value
A biopax model with the merged pathway added.

Author(s)
fkramer

pathway2AdjacencyMatrix

This function generates an adjacency matrix from the activations/inhibitions of a pathway in a biopax model. This function internally first calls pathway2RegulatoryGraph, then converts the regulatory graph to an adjacency matrix. See pathway2RegulatoryGraph for more details.

Description
This function generates an adjacency matrix from the activations/inhibitions of a pathway in a biopax model.
This function internally first calls pathway2RegulatoryGraph, then converts the regulatory graph to an adjacency matrix. See pathway2RegulatoryGraph for more details.

Usage
pathway2AdjacencyMatrix(
  biopax,
  pwid,
  expandSubpathways = TRUE,
  splitComplexMolecules = TRUE,
  useIDasNodenames = FALSE,
  verbose = TRUE
)
Arguments

biopax A biopax model
pwid string
expandSubpathways logical. If TRUE subpathways are expanded into this graph, otherwise only this very pathway is used.
splitComplexMolecules logical. If TRUE every complex is split up into its components. This leads to splitting a single node with name of the complex into several nodes with names of the components, these components all have identical edges.
useIDasNodenames logical. If TRUE nodes of the graph are named by their molecule IDs instead of using the NAME property. This can help with badly annotated/formatted databases.
verbose logical

Value

Returns the adjacency matrix representing the regulatory graph of the supplied pathway.

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
pathway2AdjacancyMatrix(biopax, pwid1)

---

pathway2Geneset

This function generates the gene set of a pathway. This function generates a gene set of all physicalEntity’s of a pathway. First all interactions of the pathway are retrieved and all components of these interactions are then listed.

Description

This function generates the gene set of a pathway.

This function generates a gene set of all physicalEntity’s of a pathway. First all interactions of the pathway are retrieved and all components of these interactions are then listed.

Usage

pathway2Geneset(biopax, pwid, returnIDonly = FALSE, biopaxlevel = 3)
pathway2Graph

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>biopax</td>
<td>A biopax model</td>
</tr>
<tr>
<td>pwid</td>
<td>string</td>
</tr>
<tr>
<td>returnIDonly</td>
<td>logical. If TRUE only IDs of the components are returned. This saves time for</td>
</tr>
<tr>
<td></td>
<td>looking up names for every single ID.</td>
</tr>
<tr>
<td>biopaxlevel</td>
<td>integer. Set the biopax level here if you supply a data.table directly.</td>
</tr>
</tbody>
</table>

Value

Returns the gene set of the supplied pathway. Returns NULL if the pathway has no components.

Author(s)

Frank Kramer

Examples

```r
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pathway2Geneset(biopax, pwid=pwid1)
```

Description

This function generates a directed graph from all the interactions of a specified pathway in a biopax model. Edges with no direction are indicated by a 0 weight.

Usage

```r
pathway2Graph(
  biopax,
  pwid,
  expandSubpathways = TRUE,
  splitComplexMolecules = FALSE,
  useIDasNodenames = TRUE,
  verbose = FALSE,
  withDisconnectedParts = TRUE
)
```
Arguments

- **biopax**: A biopax model
- **pwid**: string
- **expandSubpathways**: logical. If TRUE subpathways are expanded into this graph, otherwise only this very pathway is used.
- **splitComplexMolecules**: logical. If TRUE every complex is split up into its components. This leads to splitting a single node with name of the complex into several nodes with names of the components, these components all have identical edges. Default value is FALSE
- **useIDasNodenames**: logical. If TRUE nodes of the graph are named by their molecule IDs instead of using the NAME property. This can help with badly annotated/formatted databases.
- **verbose**: logical
- **withDisconnectedParts**: logical. If TRUE the pathway graph is returned as such, else only the largest connected component is given back

Value

Returns the a graph object of the specified pathway. Edges with no direction are indicated by a 0 weight.

Author(s)

Nirupama Benis

Examples

```r
# load data
data(biopaxLevel3Example) # location of the data
pwid <- "Pathway1019"
# build pathway using pathway2Graph
pathwayAsGraph <- pathway2Graph(biopax = biopaxLevel3Example, pwid = pwid, splitComplexMolecules = FALSE, useIDasNodenames = TRUE, verbose = FALSE, withDisconnectedParts = TRUE)
plotRegulatoryGraph(pathwayAsGraph)
# build pathway discarding the disconnected parts of the graph
pathwayAsGraph <- pathway2Graph(biopax = biopaxLevel3Example, pwid = pwid, splitComplexMolecules = FALSE, useIDasNodenames = TRUE, verbose = FALSE, withDisconnectedParts = FALSE)
pathwayAsGraph # should have 10 nodes, 11 edges
plotRegulatoryGraph(pathwayAsGraph)
```
pathway2RegulatoryGraph

This function generates the regulatory graph from the activations/inhibitions of a pathway in a biopax model. This function builds a graph from the pathway components of the supplied pathway. Only instances of class 'control' are considered, this leads to a functional graph with all edges either representing activations or inhibitions. No transports, no translocation, etc. If desired complexes can be split up into several nodes, this can sometimes lead to a more complex and cluttered graph. There can not be multiple edges between 2 nodes. Whenever duplicated edges are generated (especially by splitting up complexes) a warning is thrown.

Description

This function generates the regulatory graph from the activations/inhibitions of a pathway in a biopax model.

This function builds a graph from the pathway components of the supplied pathway. Only instances of class 'control' are considered, this leads to a functional graph with all edges either representing activations or inhibitions. No transports, no translocation, etc. If desired complexes can be split up into several nodes, this can sometimes lead to a more complex and cluttered graph. There can not be multiple edges between 2 nodes. Whenever duplicated edges are generated (especially by splitting up complexes) a warning is thrown.

Usage

pathway2RegulatoryGraph(
  biopax,  
  pwid, 
  expandSubpathways = TRUE, 
  splitComplexMolecules = TRUE, 
  useIDsAsNodenames = FALSE, 
  verbose = TRUE
)

Arguments

biopax  A biopax model
pwid  string
expandSubpathways  logical. If TRUE subpathways are expanded into this graph, otherwise only this very pathway is used.
splitComplexMolecules  logical. If TRUE every complex is split up into its components. This leads to splitting a single node with name of the complex into several nodes with names of the components, these components all have identical edges.
plotRegulatoryGraph

useIDasNodenames

logical. If TRUE nodes of the graph are named by their molecule IDs instead of using the NAME property. This can help with badly annotated/formatted databases.

verbose

logical

Value

Returns the representing the regulatory graph of the supplied pathway in a node-edge-list graph.

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph = pathway2RegulatoryGraph(biopax, pwid1)
plotRegulatoryGraph(mygraph)

plotRegulatoryGraph

This function layouts a regulatory graph and plots it using Rgraphviz.

Description

This function takes a regulatory graph as generated by pathway2regulatoryGraph and plots it using standard layout options of layoutRegulatoryGraph. This function is a wrapper for layoutRegulatoryGraph with standard parameters. Subgraphs can be painted with different colors. This can be done by passing parameter subgraph a list of character vectors with node names.

Usage

plotRegulatoryGraph(mygraph, subgraphs = list(), layoutGraph = TRUE)

Arguments

mygraph

graphNEL, regulatory graph

subgraphs

list of character vectors with node names

layoutGraph

logical. If FALSE the graph is not laid out again but send directly to Rgraphviz::renderGraph.

Value

none
Author(s)
Frank Kramer

Examples

```
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph = pathway2RegulatoryGraph(biopax, pwid1)
plotRegulatoryGraph(mygraph)
```

print.biopax

Print a biopax object.

Description
Print a biopax object.

Usage

```
## S3 method for class 'biopax'
print(x, ...)
```

Arguments

- `x`: A biopax object to print.
- `...`: Other arguments to be passed to print.

Examples

```
data(biopaxexample)
print(biopax)
```

readBiopax

This function reads in a Biopax .owl file.
Description

This function reads in a Biopax .owl file and generates the internal data.frame format used in this package. This function can take a while with really big Biopax files like NCIs Pathway Interaction Database or Reactome. In almost every case this is your starting point. Returns a biopax model, which is a list with named elements:

- **df** The data.frame representing the biopax in R
- **ns_rdf** RDF Namespace
- **ns_owl** OWL Namespace
- **ns_bp** Biopax Namespace
- **file** File name

Usage

```r
readBiopax(file, verbose = TRUE)
```

Arguments

- **file** string. File name
- **verbose** logical. Output messages about how parsing is going and so on.

Value

A biopax model

Author(s)

Frank Kramer

Examples

```r
## Not run: biopax = readBiopax(file="biopaxmodel.owl")
## Not run: biopax
`#` load data and retrieve wnt pathway
data(biopaxexample)
```

Description

This function is used internally by pathway2Graph to remove the smaller disconnected parts of the pathway graph.

removeDisconnectedParts

This function is used internally by pathway2Graph to remove the smaller disconnected parts of the pathway graph.
Usage

removeDisconnectedParts(mygraph)

Arguments

mygraph  a graph object

Author(s)

Nirupama Benis

---

removeInstance  This function removes an instance

Description

This function removes an instance from an existing biopax model.

Usage

removeInstance(biopax, id)

Arguments

biopax  A biopax model
id  string. ID of the instance

Value

Returns the supplied biopax model with the instance removed from it.

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
biopax2 = removeInstance(biopax, 1)
removeNodes

This function gracefully removes nodes from a regulatory graph.

Description

This function gracefully removes nodes from a regulatory graph. If the node to be removed has both parent and child nodes, these are connected directly. The weight of the new direct edge is the product of multiplying the incoming and outgoing edge weights of the original node.

Usage

removeNodes(graph, nodes)

Arguments

graph: graphNEL

nodes: vector of node names specifying which nodes to remove.

Value

Returns a graph with specified nodes removed.

Author(s)

Frank Kramer

Examples

# load data and retrieve wnt pathway
data(biopaxexample)
pwid1 = "pid_p_l00002_wntpathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph1 = layoutRegulatoryGraph(mygraph1)
# retrieve all nodes
nodes = nodes(mygraph1)
# random expression data for your nodes
values = rnorm(length(nodes), mean=6, sd=2)
# color nodes of the graph
mygraph1 = colorGraphNodes(mygraph1, nodes, values, colors="greenred")
# plot the now colored graph
plotRegulatoryGraph(mygraph1, layoutGraph=FALSE)
removeProperties

This function removes a property

Description

This function removes a property from an existing biopax instance.

Usage

removeProperties(biopax, id, properties)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>biopax</td>
<td>A biopax model</td>
</tr>
<tr>
<td>id</td>
<td>string. ID of the instance</td>
</tr>
<tr>
<td>properties</td>
<td>character vector. listing the properties to remove.</td>
</tr>
</tbody>
</table>

Value

Returns the supplied biopax model with properties removed from this instance.

Author(s)

Frank Kramer

Examples

```r
# load data
data(biopaxexample)
biopax2 = removeProperties(biopax, 1, "name")
```

selectInstances

Returns all instances that conform to the selection criteria.

Description

Returns all instances that conform to the selection criteria. This function returns a subset of the internal data.table of the biopax object. Selection criteria are whether instances belong to a certain class or have the specified id, property or name. Setting a criteria to NULL ignores this criteria. If returnValues is set to FALSE only the selector (a logical vector with length of the internal data.table) is returned, otherwise the selected data is returned. If includeSubClasses is set to TRUE the class criteria is broadened to include all classes that inherit from the given class, e.g. if class="control" and includeSubClasses=TRUE the function will select catalyses and modulations too, since they are a subclass of class control. If includeReferencedInstances is set to TRUE all instances that are being referenced by the selected instances are being selected too. The parameter works recursively, this means for example that a selected pathway and all its interactions, complexes, molecules and annotations are returned if this parameter is set to true. This parameter is especially helpful if you want to migrate or merge knowledge from different data bases.
selectInstances

Usage

selectInstances(
  biopax,
  id = NULL,
  class = NULL,
  property = NULL,
  name = NULL,
  returnValues = TRUE,
  includeSubClasses = FALSE,
  includeReferencedInstances = FALSE,
  returnCopy = TRUE,
  biopaxlevel = 3
)

Arguments

biopax  A biopax model or a compatible internal data.table
id     string. ID of the instances to select
class  string. Class of the instances to select
property string. Return only this property of the instances
name   string. Name of the instances to select
returnValues   logical. If returnValues is set to FALSE only the selector (a logical vector with length of the internal data.table) is returned, otherwise the selected data is returned
includeSubClasses  logical. If includeSubClasses is set to TRUE the class criteria is broadened to include all classes that inherit from the given class
includeReferencedInstances  logical. If includeReferencedInstances is set to TRUE all instances that are being referenced by the selected instances are being selected too
returnCopy   logical. Defaults to TRUE. If TRUE a copy of the internal data.table is returned. If FALSE data is returned by reference. Set to FALSE to increase speed when only ever reading data. Make sure you understand the implications of using this! See vignette of data.table package.
biopaxlevel integer. Set the biopax level here if you supply a data.table directly.

Value

Returns a data.table containing all instances conforming to the given selection criteria if returnValues=TRUE, only the selector for the internal data.table otherwise.

Author(s)

Frank Kramer
splitComplex

This function splits up a complex into its components.

Description

This function looks up the supplied Complex ID and returns the names of all its components.

Usage

splitComplex(
  biopax,
  complexid,
  recursive = TRUE,
  returnIDonly = FALSE,
  biopaxlevel = 3
)

Arguments

biopax | A biopax model
complexid | string ID of an complex
recursive | logical
returnIDonly | logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
biopaxlevel | integer. Set the biopax level here if you supply a data.table directly.

Value

Returns a character vector with the names of all subcomponents.

Author(s)

Frank Kramer
Examples

```r
# load data
data(biopaxexample)
selectInstances(biopax, id="ex_m_100650")
listInstances(biopax, id="ex_m_100650")
listComplexComponents(biopax, id="ex_m_100650")
splitComplex(biopax, complexId="ex_m_100650")
```

---

striphash

Strips a hash in front of a string

**Description**

Strips a hash in front of a string

**Usage**

```
striphash(x)
```

**Arguments**

- `x`: A string to be stripped off a preceding hash

**Value**

The supplied string with a hash "#" stripped off front.

**Author(s)**

Frank Kramer

---

stripns

Strips a namespace tag off a supplied classname string

**Description**

Strips a namespace tag off a supplied classname string

**Usage**

```
stripns(classname)
```

**Arguments**

- `classname`: A string containing a classname preceded by a namespace tag
transitiveClosure

Value

The classname with the namespace tag stripped off it.

Author(s)

Frank Kramer

transitiveClosure This function generates the transitive closure of the supplied graph.

Description

This function generates the transitive closure of the supplied graph. In short: if A->B->C then an edge A->C is added. Edge weights are conserved if possible (in a hopefully smart way). This is a simple convenience wrapper for the RBGL function transitive.closure.

Usage

transitiveClosure(mygraph)

Arguments

mygraph graphNEL

Value

Returns the transitive closure of the supplied graph.

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph = pathway2RegulatoryGraph(biopax, pwid1)
tc = transitiveClosure(mygraph)
transitiveReduction

This function generates the transitive reduction of the supplied graph.

Description

This function is deprecated due to nem dropping out of Bioconductor in BioC 4.0. This function generates the transitive reduction of the supplied graph. In short: if A->B->C AND A->C then edge A->C is removed. This is a simple convenience wrapper for the NEM function transitive.reduction. Be aware of implications on the edge weights!

Usage

transitiveReduction(mygraph)

Arguments

mygraph          graphNEL

Value

Returns the transitive reduction of the supplied graph.

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph = pathway2RegulatoryGraph(biopax, pwid1)
tr = transitiveReduction(mygraph)

unfactorize

Replace factors/levels in a data.frame and use plain strings instead

Description

This function takes a data.frame as argument and returns it with strings instead of factors.

Usage

unfactorize(df)
Arguments
def: any data.frame with factor levels in at least one column

Value
The data.frame is returned using strings instead of factors.

Author(s)
Frank Kramer

This function unites two graphs.

Description
This function unites the two supplied graphs. Layout parameters from graph1 are used. If colorNodes==TRUE the returned graph has different colors for overlapping nodes and nodes individual for each graph.

Usage
uniteGraphs(
  graph1,
  graph2,
  colorNodes = TRUE,
  colors = c("#B3E2CD", "#FDCDAC", "#F4CAE4")
)

Arguments
graph1: graphNEL
graph2: graphNEL
colorNodes: logical
colors: colors character vector of colors. If colorNodes==TRUE these colors are used for graph1 and graph2 respectively.

Value
Return a graph generated by uniting the two supplied graphs

Author(s)
Frank Kramer
**Examples**

```r
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph2 = pathway2RegulatoryGraph(biopax, pwid2)
plotRegulatoryGraph(uniteGraphs(mygraph1,mygraph2))
```

---

**writeBiopax**

*This function writes out a biopax model.*

**Description**

This function writes out a biopax model, as generated by readBiopax, to either a file or returns the xmlTree if file is omitted.

**Usage**

```r
writeBiopax(
  biopax,
  file = "",
  verbose = TRUE,
  overwrite = FALSE,
)
```

**Arguments**

- `biopax`: A biopax model as generated by readBiopax
- `file`: A string giving a file name.
- `verbose`: logical
- `overwrite`: logical, if TRUE an already existing file will be overwritten, otherwise an error is thrown
- `namespaces`: A list of namespaces to use for the generated XML/RDF file

**Value**

Returns the xmlTree object generated from the biopax model. If a filename is supplied the XML is written to this file.

**Author(s)**

Frank Kramer
