Package ‘scPipe’

March 2, 2024

Title Pipeline for single cell multi-omic data pre-processing

Date 2022-10-12

Version 2.2.0

Type Package

biocViews ImmunoOncology, Software, Sequencing, RNASeq, GeneExpression, SingleCell, Visualization, SequenceMatching, Preprocessing, QualityControl, GenomeAnnotation, DataImport

Description A preprocessing pipeline for single cell RNA-seq/ATAC-seq data that starts from the fastq files and produces a feature count matrix with associated quality control information. It can process fastq data generated by CEL-seq, MARS-seq, Dropseq, Chromium 10x and SMART-seq protocols.

Depends R (>= 4.2.0), SingleCellExperiment

LinkingTo Rcpp, Rhtslib (>= 1.13.1), zlibbioc, testthat

Imports AnnotationDbi, basilisk, BiocGenerics, biomaRt, Biostrings, data.table, dplyr, DropletUtils, flexmix, GenomicRanges, GenomicAlignments, GGally, ggplot2, glue (>= 1.3.0), grDevices, graphics, hash, IRanges, magrittr, MASS, Matrix (>= 1.5.0), mclust, methods, MultiAssayExperiment, org.Hs.eg.db, org.Mm.eg.db, purrr, Rcpp (>= 0.11.3), reshape, reticulate, Rhtslib, rlang, robustbase, Rsamtools, Rsubread, rtracklayer, SummarizedExperiment, S4Vectors, scales, stats, stringr, tibble, tidyr, tools, utils, vctrs (>= 0.5.2)

SystemRequirements C++11, GNU make

License GPL (>= 2)

Encoding UTF-8

RoxygenNote 7.2.3

NeedsCompilation yes

Index 68
.qq_outliers_robust  \[Detect\text{ }outliers\text{ }based\text{ }on\text{ }robust\text{ }linear\text{ }regression\text{ }of\text{ }QQ\text{ }plot\]

Description

Detect outliers based on robust linear regression of QQ plot

Usage

```r
.qq_outliers_robust(x, df, conf)
```

Arguments

- `x`  
a vector of mahalanobis distance
- `df`  
degree of freedom for chi-square distribution
- `conf`  
confidence for linear regression

Value

cell names of outliers

anno_import  \[Import\text{ }gene\text{ }annotation\]

Description

Because of the variations in data format depending on annotation source, this function has only been tested with human annotation from ENSEMBL, RefSeq and Gencode. If it behaves unexpectedly with any annotation please submit an issue at www.github.com/LuyiTian/scPipe with details.

Usage

```r
anno_import(filename)
```

Arguments

- `filename`  
The name of the annotation gff3 or gtf file. File can be gzipped.

Details

Imports and GFF3 or GTF gene annotation file and transforms it into a SAF formatted data.frame. SAF described at http://bioinf.wehi.edu.au/featureCounts/. SAF contains positions for exons, strand and the GeneID they are associated with.
anno_to_saf

Value
data.frame containing exon information in SAF format

Examples

ens_chrY <- anno_import(system.file("extdata", "ensembl_hg38_chrY.gtf.gz", package = "scPipe"))

anno_to_saf

Convert annotation from GenomicRanges to Simple Annotation Format (SAF)

Description

This function converts a GRanges object into a data.frame of the SAF format for scPipe’s consumption. The GRanges object should contain a "type" column where at least some features are annotated as "exon", in addition there should be a gene_id column specifying the gene to which the exon belongs. In the SAF only the gene ID, chromosome, start, end and strand are recorded, this is a gene-exon centric format, with all entries containing the same gene ID treated as exons of that gene. It is possible to count alternative features by setting the gene_id column to an arbitrary feature name and having alternative features in the SAF table, the main caveat is that the features are still treated as exons, and the mapping statistics for exon and intron will not reflect biological exons and introns but rather the annotation features.

Usage

anno_to_saf(anno)

Arguments

anno The GRanges object containing exon information

Details

Convert a GRanges object containing type and gene_id information into a SAF format data.frame. SAF described at http://bioinf.wehi.edu.au/featureCounts/. SAF contains positions for exons, strand and the GeneID they are associated with.

Value
data.frame containing exon information in SAF format
calculate_QC_metrics

Calculate QC metrics from gene count matrix

description

Calculate QC metrics from gene count matrix

Usage

calculate_QC_metrics(sce)

Arguments

sce a SingleCellExperiment object containing gene counts

details

get QC metrics using gene count matrix. The QC statistics added are

- number_of_genes number of genes detected.
- total_count_per_cell sum of read number after UMI deduplication.
- non_mt_percent 1 - percentage of mitochondrial gene counts. Mitochondrial genes are retrieved by GO term GO:0005739
- non_ERCC_percent ratio of exon counts to ERCC counts
- non_ribo_percent 1 - percentage of ribosomal gene counts ribosomal genes are retrieved by GO term GO:0005840.

value

an SingleCellExperiment with updated QC metrics

Examples

data("sc_sample_data")
data("sc_sample_qc")
sce <- SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) <- "mmusculus_gene_ensembl"
gene_id_type(sce) <- "ensembl_gene_id"
QC_metrics(sce) <- sc_sample_qc
cell_barcode_matching <- cell_barcode_matching
UMI_dup_info(sce) <- UMI_duplication

# The sample qc data already run through function `calculate_QC_metrics`.
# So we delete these columns and run `calculate_QC_metrics` to get them again:
colnames(colnames(QC_metrics(sce)))
QC_metrics(sce) <- QC_metrics(sce)[,c("unaligned","aligned_unmapped","mapped_to_exon")]
sce = calculate_QC_metrics(sce)
colnames(QC_metrics(sce))

Description
This data.frame contains cell barcode demultiplex statistics with several rows:

- barcode_unmatch_ambiguous_mapping is the number of reads that do not match any barcode, but aligned to the genome and mapped to multiple features.
- barcode_unmatch_mapped_to_intron is the number of reads that do not match any barcode, but aligned to the genome and mapped to intron.
- barcode_match is the number of reads that match the cell barcodes
- barcode_unmatch_unaligned is the number of reads that do not match any barcode, and not aligned to the genome
- barcode_unmatch_aligned is the number of reads that do not match any barcode, but aligned to the genome and do not mapped to any feature
- barcode_unmatch_mapped_to_exon is the number of reads that do not match any barcode, but aligned to the genome and mapped to the exon

Format
a data.frame instance, one row per cell.

Value
NULL, but makes a data frame with cell barcode demultiplex statistics

Author(s)
Luyi Tian

Source
Christin Biben (WEHI). She FACS sorted cells from several immune cell types including B cells, granulocyte and some early progenitors.
Examples

data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication

demultiplex_info(sce)

check_barcode_start_position

Check Valid Barcode Start Position

Description

Checks to see if the given barcode start position (bstart) is valid for the fastq file. If the found barcode percentage is less than the given threshold, a new barcode start position is searched for by checking every position from the start of each read to 10 bases after the bstart

Usage

check_barcode_start_position(
  fastq,
  barcode_file,
  barcode_file_realname,
  bstart,
  blength,
  search_lines,
  threshold
)

Arguments

fastq file containing reads
barcode_file csv file
barcode_file_realname the real name of the csv file
bstart the start position for barcodes in the given reads
blength length of each barcode
search_lines the number of fastq lines to use for the check
threshold the minimum percentage of found barcodes to accept for the program to continue
**Value**

Boolean: TRUE if program can continue execution, FALSE otherwise.

**convert_geneid**

convert the gene ids of a SingleCellExperiment object

**Description**

convert the gene ids of a SingleCellExperiment object

**Usage**

\`
convert_geneid(sce, returns = "external_gene_name", all = TRUE)
\`;

**Arguments**

- `sce`: a SingleCellExperiment object
- `returns`: the gene id which is set as return. Default to be `external_gene_name`. A possible list of attributes can be retrieved using the function `listAttributes` from the `biomaRt` package. The commonly used id types are `external_gene_name`, `ensembl_gene_id` or `entrezgene`.
- `all`: logic. For genes that cannot covert to new gene id, keep them with the old id or delete them. The default is keep them.

**Details**

close the gene id of all datas in the SingleCellExperiment object

**Value**

sce with converted id

**Examples**

```r
# the gene id in example data are `external_gene_name`
# the following example will convert it to `external_gene_name`

data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication
head(rownames(sce))
sce = convert_geneid(sce, return="external_gene_name")
head(rownames(sce))
```
Description

Create an HTML report summarising pro-processed data. This is an alternative to the more verbose `create_report` that requires only the processed counts and stats folders.

Usage

```r
create_processed_report(
  outdir = ".",
  organism,
  gene_id_type,
  report_name = "report"
)
```

Arguments

- `outdir` output folder.
- `organism` the organism of the data. List of possible names can be retrieved using the function `listDatasets` from `biomaRt` package. (e.g. `mmusculus_gene_ensembl` or `hsapiens_gene_ensembl`).
- `gene_id_type` gene id type of the data A possible list of ids can be retrieved using the function `listAttributes` from `biomaRt` package. the commonly used id types are `external_gene_name`, `ensembl_gene_id` or `entrezgene`.
- `report_name` the name of the report .Rmd and .html files.

Value

file path of the created compiled document.

Examples

```r
## Not run:
create_report(
  outdir="output_dir_of_scPipe",
  organism="mmusculus_gene_ensembl",
  gene_id_type="ensembl_gene_id")

## End(Not run)
```
create_report

Description

create an HTML report using data generated by preprocessing step.

Usage

```r
create_report(
    sample_name, 
    outdir, 
    r1 = "NA", 
    r2 = "NA", 
    outfq = "NA", 
    read_structure = list(bs1 = 0, b1l = 0, bs2 = 0, b2l = 0, us = 0, ul = 0), 
    filter_settings = list(rmlow = TRUE, rmN = TRUE, minq = 20, numbq = 2), 
    align_bam = "NA", 
    genome_index = "NA", 
    map_bam = "NA", 
    exon_anno = "NA", 
    stnd = TRUE, 
    fix_chr = FALSE, 
    barcode_anno = "NA", 
    max_mis = 1, 
    UMI_cor = 1, 
    gene_fl = FALSE, 
    organism, 
    gene_id_type
)
```

Arguments

- `sample_name`: sample name
- `outdir`: output folder
- `r1`: file path of read1
- `r2`: file path of read2 default to be NULL
- `outfq`: file path of the output of `sc_trim_barcode`
- `read_structure`: a list contains read structure configuration. For more help see `?sc_trim_barcode`
- `filter_settings`: a list contains read filter settings for more help see `?sc_trim_barcode`
- `align_bam`: the aligned bam file
- `genome_index`: genome index used for alignment
- `map_bam`: the mapped bam file
create_report

exon_anno: the gff exon annotation used. Can have multiple files.

std: whether to perform strand specific mapping.

fix_chr: add 'chr' to chromosome names, fix inconsistent names.

barcode_anno: cell barcode annotation file path.

max_mis: maximum mismatch allowed in barcode. Default to be 1.

UMI_cor: correct UMI sequence error: 0 means no correction, 1 means simple correction and merge UMI with distance 1.

gene_fl: whether to remove low abundant gene count. Low abundant is defined as only one copy of one UMI for this gene.

organism: the organism of the data. List of possible names can be retrieved using the function 'listDatasets' from 'biomaRt' package. (i.e 'mmusculus_gene_ensembl' or 'hsapiens_gene_ensembl')

gene_id_type: gene id type of the data. A possible list of ids can be retrieved using the function 'listAttributes' from 'biomaRt' package. The commonly used id types are 'external_gene_name', 'ensembl_gene_id' or 'entrezgene'.

Value

no return

Examples

```r
## Not run:
create_report(sample_name="sample_001",
  outdir="output_dir_of_scPipe",
  r1="read1.fq",
  r2="read2.fq",
  outfq="trim.fq",
  read_structure=list(bs1=-1, bl1=2, bs2=6, bl2=8, us=0, ul=6),
  filter_settings=list(rmlow=TRUE, rmN=TRUE, minq=20, numbq=2),
  align_bam="align.bam",
  genome_index="mouse.index",
  map_bam="aligned.mapped.bam",
  exon_anno="exon_anno.gff3",
  stnd=TRUE,
  fix_chr=FALSE,
  barcode_anno="cell_barcode.csv",
  max_mis=1,
  UMI_cor=1,
  gene_fl=FALSE,
  organism="mmusculus_gene_ensembl",
  gene_id_type="ensembl_gene_id")

## End(Not run)
```
create_sce_by_dir

create a SingleCellExperiment object from data folder generated by preprocessing step

**Description**

after we run sc_gene_counting and finish the preprocessing step. create_sce_by_dir can be used to generate the SingleCellExperiment object from the folder that contains gene count matrix and QC statistics. it can also generate the html report based on the gene count and quality control statistics

**Usage**

```r
create_sce_by_dir(
  datadir,
  organism = NULL,
  gene_id_type = NULL,
  pheno_data = NULL,
  report = FALSE
)
```

**Arguments**

datadir the directory that contains all the data and 'stat' subfolder.
organism the organism of the data. List of possible names can be retrieved using the function `listDatasets` from `biomaRt` package. (i.e `mmusculus_gene_ensembl` or `hsapiens_gene_ensembl`)
gene_id_type gene id type of the data A possible list of ids can be retrieved using the function `listAttributes` from `biomaRt` package. the commonly used id types are `external_gene_name`, `ensembl_gene_id` or `entrezgene`
pheno_data the external phenotype data that linked to each single cell. This should be an AnnotatedDataFrame object
report whether to generate the html report in the data folder

**Details**

after we run sc_gene_counting and finish the preprocessing step. create_sce_by_dir can be used to generate the SingleCellExperiment object from the folder that contains gene count matrix and QC statistics.

**Value**

a SingleCellExperiment object
Examples

```r
## Not run:
# the sce can be created from the output folder of scPipe
# please refer to the vignettes
sce = create_sce_by_dir(datadir="output_dir_of_scPipe",
                       organism="mmusculus_gene_ensembl",
                       gene_id_type="ensembl_gene_id")

## End(Not run)
# or directly from the gene count and quality control matrix:
data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data))),
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication
dim(sce)
```

---

demultiplex_info  demultiplex_info

Description

Get or set cell barcode demultiplex results in a SingleCellExperiment object

Usage

```r
demultiplex_info(object)
demultiplex_info(object) <- value
demultiplex_info.sce(object)
```

```r
## S4 method for signature 'SingleCellExperiment'
demultiplex_info(object)
```

```r
## S4 replacement method for signature 'SingleCellExperiment'
demultiplex_info(object) <- value
```

Arguments

- `object`: A `SingleCellExperiment` object.
- `value`: Value to be assigned to corresponding object.
Value

da dataframe of cell barcode demultiplex information
A DataFrame of cell barcode demultiplx results.

Author(s)

Luyi Tian

Examples

data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication

demultiplex_info(sce)

detect_outlier

Detect outliers based on QC metrics

Description

This algorithm will try to find comp number of components in quality control metrics using a Gaussian mixture model. Outlier detection is performed on the component with the most genes detected. The rest of the components will be considered poor quality cells. More cells will be classified low quality as you increase comp.

Usage

detect_outlier(
  sce,
  comp = 1,
  sel_col = NULL,
  type = c("low", "both", "high"),
  conf = c(0.9, 0.99),
  batch = FALSE
)
Arguments

sce a SingleCellExperiment object containing QC metrics.
comp the number of component used in GMM. Depending on the quality of the experiment.
seļ_col a vector of column names which indicate the columns to use for QC. By default it will be the statistics generated by `calculate_QC_metrics()`
type only looking at low quality cells (‘low’) or possible doublets (‘high’) or both (‘both’)
conf confidence interval for linear regression at lower and upper tails. Usually, this is smaller for lower tail because we hope to pick out more low quality cells than doublets.
batch whether to perform quality control separately for each batch. Default is FALSE. If set to TRUE then you should have a column called ‘batch’ in the ‘colData(sce)’.

Details
detect outlier using Mahalanobis distances

Value

an updated SingleCellExperiment object with an ‘outlier‘ column in colData

Examples

data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex.info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication
# the sample qc data already run through function `calculate_QC_metrics`
# for a new sce please run `calculate_QC_metrics` before `detect_outlier`
sce = detect_outlier(sce)
table(QC_metrics(sce)$outliers)

feature_info Get or set feature_info from a SingleCellExperiment object

Description

Get or set feature_info from a SingleCellExperiment object
Usage

feature_info(object)

feature_info(object) <- value

feature_info.sce(object)

## S4 method for signature 'SingleCellExperiment'
feature_info(object)

## S4 replacement method for signature 'SingleCellExperiment'
feature_info(object) <- value

Arguments

object       A SingleCellExperiment object.
value       Value to be assigned to corresponding object.

Value

a dataframe of feature info for scATAC-seq data
A DataFrame of feature information

Author(s)

Shani Amarasinghe

feature_type  Get or set feature_type from a SingleCellExperiment object

Description

Get or set feature_type from a SingleCellExperiment object

Usage

feature_type(object)

feature_type(object) <- value

feature_type.sce(object)

## S4 method for signature 'SingleCellExperiment'
feature_type(object)

## S4 replacement method for signature 'SingleCellExperiment'
feature_type(object) <- value
Arguments

object  A *SingleCellExperiment* object.
value   Value to be assigned to corresponding object.

Value

the feature type used in feature counting for scATAC-Seq data
A string representing the feature type

Author(s)

Shani Amarasinghe

---

gene_id_type  *Get or set gene_id_type from a SingleCellExperiment object*

Description

Get or set gene_id_type from a SingleCellExperiment object

Usage

```
gene_id_type(object)
gene_id_type(object) <- value
gene_id_type.sce(object)
```

```
## S4 method for signature 'SingleCellExperiment'
gene_id_type(object)

## S4 replacement method for signature 'SingleCellExperiment'
gene_id_type(object) <- value
```

Arguments

object  A *SingleCellExperiment* object.
value   Value to be assigned to corresponding object.

Value

the gene id type used by Biomart
gene id type string

Author(s)

Luyi Tian
Examples

data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication

gene_id_type(sce)

---

get_chromosomes \hspace{1cm} Get Chromosomes

Description

Gets a list of NamedList of chromosomes and the reference length acquired through the bam index file.

Usage

get_chromosomes(bam, keep_contigs = "^chr")

Arguments

bam file path to the bam file to get data from
keep_contigs regular expression used with grepl to filter reference names

Value

a named list where element names are chromosomes reference names and elements are integer lengths

---

get_ercc_anno \hspace{1cm} Get ERCC annotation table

Description

Helper function to retrieve ERCC annotation as a dataframe in SAF format

Usage

get_ercc_anno()
Value
data.frame containing ERCC annotation

Examples
ercc_anno <- get_ercc_anno()

get_genes_by_GO
Get genes related to certain GO terms from biomart database

Description
Get genes related to certain GO terms from biomart database

Usage
get_genes_by_GO(
  returns = "ensembl_gene_id",
  dataset = "mmusculus_gene_ensembl",
  go = NULL
)

Arguments
returns the gene id which is set as return. Default to be ensembl id A possible list of attributes can be retrieved using the function listAttributes from biomaRt package. The commonly used id types are 'external_gene_name', 'ensembl_gene_id' or 'entrezgene'.
dataset Dataset you want to use. List of possible datasets can be retrieved using the function listDatasets from biomaRt package.
go a vector of GO terms

Details
Get genes related to certain GO terms from biomart database

Value
a vector of gene ids.

Examples
# get all genes under GO term GO:0005739 in mouse, return ensembl gene id
get_genes_by_GO(returns="ensembl_gene_id",
    dataset="mmusculus_gene_ensembl",
    go=c('GO:0005739'))
get_read_str

Get read structure for particular scRNA-seq protocol

Description
The supported protocols are:
- CelSeq
- CelSeq2
- DropSeq
- 10x (also called ChromiumV1)

If you know the structure of a specific protocol and would like it supported, please leave an issue post at www.github.com/luyitian/scPipe.

Usage
get_read_str(protocol)

Arguments
protocol name of the protocol

Value
list of UMI and Barcode locations for use in other scPipe functions

Examples
get_read_str("celseq")

organism.sce

Get or set organism from a SingleCellExperiment object

Description
Get or set organism from a SingleCellExperiment object

Usage
organism.sce(object)

## S4 method for signature 'SingleCellExperiment'
organism(object)

## S4 replacement method for signature 'SingleCellExperiment'
organism(object) <- value
Arguments

object A SingleCellExperiment object.
value Value to be assigned to corresponding object.

Value

organism string

Author(s)

Luyi Tian

Examples

```r
data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication
organism(sce)
```

Description

Plot cell barcode demultiplexing result for the SingleCellExperiment. The barcode demultiplexing result is shown using a barplot, with the bars indicating proportions of total reads. Barcode matches and mismatches are summarised along with whether or not the read mapped to the genome. High proportion of genome aligned reads with no barcode match may indicate barcode integration failure.

Usage

```r
plot_demultiplex(sce)
```

Arguments

sce a SingleCellExperiment object

Value

a ggplot2 bar chart
plot_mapping

Examples

data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication

plot_demultiplex(sce)

plot_mapping

Plot mapping statistics for SingleCellExperiment object.

Description

Plot mapping statistics for SingleCellExperiment object.

Usage

plot_mapping(sce, sel_col = NULL, percentage = FALSE, dataname = "")

Arguments

sce a SingleCellExperiment object
sel_col a vector of column names, indicating the columns to use for plot. by default it will be the mapping result.
percentage TRUE to convert the number of reads to percentage
dataname the name of this dataset, used as plot title

Value

a ggplot2 object

Examples

data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication

plot_mapping(sce,percentage=TRUE,dataname="sc_sample")
**plot_QC_pairs**  
*Plot GGAlly pairs plot of QC statistics from SingleCellExperiment object*

**Description**  
Plot GGAlly pairs plot of QC statistics from SingleCellExperiment object.

**Usage**  
```r
plot_QC_pairs(sce, sel_col = NULL)
```

**Arguments**  
- `sce`: a SingleCellExperiment object  
- `sel_col`: a vector of column names which indicate the columns to use for plot. By default it will be the statistics generated by `calculate_QC_metrics()`.

**Value**  
a ggplot2 object

**Examples**
```r
data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication
sce = detect_outlier(sce)
plot_QC_pairs(sce)
```

---

**plot_UMI_dup**  
*Plot UMI duplication frequency*

**Description**  
Plot the UMI duplication frequency.

**Usage**  
```r
plot_UMI_dup(sce, log10_x = TRUE)
```
**QC_metrics**

**Arguments**

- **sce**: a SingleCellExperiment object
- **log10_x**: whether to use log10 scale for x axis

**Value**

a line chart of the UMI duplication frequency

**Examples**

data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication
plot_UMI_dup(sce)

---

**Description**

Get or set quality control metrics in a SingleCellExperiment object

**Usage**

QC_metrics(object)

QC_metrics(object) <- value

QC_metrics.sce(object)

## S4 method for signature 'SingleCellExperiment'
QC_metrics(object)

## S4 replacement method for signature 'SingleCellExperiment'
QC_metrics(object) <- value

**Arguments**

- **object**: A SingleCellExperiment object.
- **value**: Value to be assigned to corresponding object.
**Value**

a dataframe of quality control metrics

A DataFrame of quality control metrics.

**Author(s)**

Luyi Tian

**Examples**

```r
data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
QC_metrics(sce) = sc_sample_qc

head(QC_metrics(sce))
```

---

**read_cells**

Read Cell barcode file

**Description**

Read Cell barcode file

**Usage**

`read_cells(cells)`

**Arguments**

`cells`  
the file path to the barcode file. Assumes one barcode per line or barcode csv. Or, cells can be a comma delimited string of barcodes

**Value**

a character vector of the provided barcodes
remove_outliers

Description

Removes outliers flagged by detect_outliers()

Usage

remove_outliers(sce)

Arguments

sce a SingleCellExperiment object

Value

a SingleCellExperiment object without outliers

Examples

data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication
sce = detect_outlier(sce)
dim(sce)
sce = remove_outliers(sce)
dim(sce)

scPipe

scPipe - single cell RNA-seq pipeline

Description

The scPipe will do cell barcode demultiplexing, UMI deduplication and quality control on fastq data generated from all protocols

Author(s)

Luyi Tian <tian.l@wehi.edu.au>; Shian Su <su.s@wehi.edu.au>
After we run the `sc_trim_barcode` or `sc_atac_trim_barcode` to demultiplex the fastq files, we are using this function to align those fastq files to a known reference.

**Usage**

```r
csc_aligning(R1, 
R2 = NULL, 
technology = "atac", 
index_path = NULL, 
ref = NULL, 
output_folder = NULL, 
output_file = NULL, 
input_format = "FASTQ", 
output_format = "BAM", 
type = "dna", 
nthreads = 1)
```

**Arguments**

- **R1**: a mandatory character vector including names of files that include sequence reads to be aligned. For paired-end reads, this gives the list of files including first reads in each library. File format is FASTQ/FASTA by default.
- **R2**: a character vector, the second fastq file, which is required if the data is paired-end.
- **technology**: a character string giving the sequencing technology. Possible value includes "atac" or "rna".
- **index_path**: character string specifying the path/basename of the index files, if the Rsubread genome build is available.
- **ref**: a character string specifying the path to reference genome file (.fasta, .fa format).
- **output_folder**: a character string, the name of the output folder.
- **output_file**: a character vector specifying names of output files. By default, names of output files are set as the file names provided in R1 added with an suffix string.
- **input_format**: a string indicating the input format.
- **output_format**: a string indicating the output format.
- **type**: type of sequencing data (‘RNA’ or ‘DNA’).
- **nthreads**: numeric value giving the number of threads used for mapping.
**Value**

the file path of the output aligned BAM file

**Examples**

```r
## Not run:
sc_aligning(index_path,
tech = 'atac',
R1, 
R2, 
nthreads = 6)

## End(Not run)
```

---

**sc_atac_bam_tagging**  
**BAM tagging**

**Description**

Demultiplexes the reads

**Usage**

```r
sc_atac_bam_tagging(
inbam,  
output_folder = NULL,  
bc_length = NULL,  
bam_tags = list(bc = "CB", mb = "OX"),  
nthreads = 1
)
```

**Arguments**

- `inbam`: The input BAM file
- `output_folder`: The path of the output folder
- `bc_length`: The length of the cellular barcodes
- `bam_tags`: The BAM tags
- `nthreads`: The number of threads

**Details**

`sc_atac_bam_tagging()`

**Value**

file path of the resultant demultiplexed BAM file.
Examples

```r
r1 <- system.file("extdata", "small_chr21_R1.fastq.gz", package="scPipe")
r2 <- system.file("extdata", "small_chr21_R3.fastq.gz", package="scPipe")
barcode_fastq <- system.file("extdata", "small_chr21_R2.fastq.gz", package="scPipe")
out <- tempdir()

sc_atac_trim_barcode(r1=r1, r2=r2, bc_file=barcode_fastq, output_folder=out)

demux_r1 <- file.path(out, "demux_completematch_small_chr21_R1.fastq.gz")
demux_r2 <- file.path(out, "demux_completematch_small_chr21_R3.fastq.gz")
reference <- system.file("extdata", "small_chr21.fa", package="scPipe")

aligned_bam <- sc_aligning(ref=reference, R1=demux_r1, R2=demux_r2, nthreads=6, output_folder=out)

out_bam <- sc_atac_bam_tagging(
  inbam = aligned_bam,
  output_folder = out,
  nthreads = 6)
```

---

**sc_atac_cell_calling**  
**identifying true vs empty cells**

Description

The methods to call true cells are of various ways. Implement (i.e. filtering from scATAC-Pro as default

Usage

```r
sc_atac_cell_calling(
  mat,
  cell_calling = "filter",
  output_folder,
  genome_size = NULL,
  cell_qc_metrics_file = NULL,
  lower = NULL,
  min_uniq_frags = 3000,
  max_uniq_frags = 50000,
  min_frac_peak = 0.3,
  min_frac_tss = 0,
  min_frac_enhancer = 0,
  min_frac_promoter = 0.1,
  max_frac_mito = 0.15
)
```
Arguments

mat the feature by cell matrix.
cell_calling the cell calling approach, possible options were "emptydrops", "cellranger" and "filter". But we opten to using "filter" as it was most robust. "emptydrops" is still an option for data with large number of cells.
output_folder output directory for the cell called matrix.
genome_size genome size for the data in feature by cell matrix.
cell_qc_metrics_file quality per barcode file for the barcodes in the matrix if using the cellranger or filter options.
lower the lower threshold for the data if using the emptydrops function for cell calling.
min_uniq_frags The minimum number of required unique fragments required for a cell (used for filter cell calling)
max_uniq_frags The maximum number of required unique fragments required for a cell (used for filter cell calling)
min_frac_peak The minimum proportion of fragments in a cell to overlap with a peak (used for filter cell calling)
min_frac_tss The minimum proportion of fragments in a cell to overlap with a tss (used for filter cell calling)
min_frac_enhancer The minimum proportion of fragments in a cell to overlap with a enhancer sequence (used for filter cell calling)
min_frac_promoter The minimum proportion of fragments in a cell to overlap with a promoter sequence (used for filter cell calling)
max_frac_mito The maximum proportion of fragments in a cell that are mitochondrial (used for filter cell calling)

Examples

```r
## Not run:
scc_atac_cell_calling <- function(mat,
cell_calling,
output_folder,
genome_size = NULL,
cell_qc_metrics_file = NULL,
lower = NULL)
## End(Not run)
```
sc_atac_create_cell_qc_metrics

*Generating a file useful for producing the qc plots*

**Description**

uses the peak file and annotation files for features

**Usage**

```r
csc_atac_create_cell_qc_metrics(
    frags_file,
    peaks_file,
    promoters_file,
    tss_file,
    enhs_file,
    output_folder
)
```

**Arguments**

- `frags_file` The fragment file
- `peaks_file` The peak file
- `promoters_file` The path of the promoter annotation file
- `tss_file` The path of the tss annotation file
- `enhs_file` The path of the enhs annotation file
- `output_folder` The path of the output folder for resultant files

**Value**

Nothing (Invisible 'NULL')

---

sc_atac_create_fragments

*Generating the popular fragments for scATAC-Seq data*

**Description**

Takes in a tagged and sorted BAM file and outputs the associated fragments in a .bed file
sc_atac_create_fragments

Usage

sc_atac_create_fragments(
    inbam,
    output_folder = "",
    min_mapq = 30,
    nproc = 1,
    cellbarcode = "CB",
    chromosomes = "^chr",
    readnameBarcode = NULL,
    cells = NULL,
    max_distance = 5000,
    min_distance = 10,
    chunksize = 5e+05
)

Arguments

inbam The tagged, sorted and duplicate-free input BAM file
output_folder The path of the output folder
min_mapq : int Minimum MAPQ to retain fragment
nproc : int, optional Number of processors to use. Default is 1.
cellbarcode : str Tag used for cell barcode. Default is CB (used by cellranger)
chromosomes : str, optional Regular expression used to match chromosome names to include in the output file. Default is "(?i)^chr" (starts with "chr", case-insensitive). If None, use all chromosomes in the BAM file.
readnameBarcode : str, optional Regular expression used to match cell barcode stored in read name. If None (default), use read tags instead. Use "[^:]*" to match all characters before the first colon (":").
cells : str File containing list of cell barcodes to retain. If None (default), use all cell barcodes found in the BAM file.
max_distance : int, optional Maximum distance between integration sites for the fragment to be retained. Allows filtering of implausible fragments that likely result from incorrect mapping positions. Default is 5000 bp.
min_distance : int, optional Minimum distance between integration sites for the fragment to be retained. Allows filtering implausible fragments that likely result from incorrect mapping positions. Default is 10 bp.
chunksize : int Number of BAM entries to read through before collapsing and writing fragments to disk. Higher chunksize will use more memory but will be faster.

Value

returns NULL
sc_atac_create_report  HTML report generation

Description

Generates a HTML report using the output folder produced by the pipeline

Usage

sc_atac_create_report(
  input_folder,
  output_folder = NULL,
  organism = NULL,
  sample_name = NULL,
  feature_type = NULL,
  n_barcode_subset = 500
)

Arguments

input_folder  The path of the folder produced by the pipeline
output_folder  The path of the output folder to store the HTML report in
organism  A string indicating the name of the organism being analysed
sample_name  A string indicating the name of the sample
feature_type  A string indicating the type of the feature (‘genome_bin’ or ‘peak’)
n_barcode_subset  if you require only to visualise stats for a sample of barcodes to improve processing time (integer)

Value

the path of the output file

sc_atac_create_sce  sc_atac_create_sce()

Description

sc_atac_create_sce()
Usage

```r
sc_atac_create_sce(
    input_folder = NULL,
    organism = NULL,
    sample_name = NULL,
    feature_type = NULL,
    pheno_data = NULL,
    report = FALSE
)
```

Arguments

- `input_folder` : The output folder produced by the pipeline
- `organism` : The type of the organism
- `sample_name` : The name of the sample
- `feature_type` : The type of the feature
- `pheno_data` : The pheno data
- `report` : Whether or not a HTML report should be produced

Value

- a SingleCellExperiment object created from the scATAC-Seq data provided

Examples

```r
## Not run:
sc_atac_create_sce(
    input_folder = input_folder,
    organism = "hg38",
    feature_type = "peak",
    report = TRUE)
## End(Not run)
```

Description

The empty drops cell calling method

Usage

```r
sc_atac_emptydrops_cell_calling(mat, output_folder, lower = NULL)
```
Arguments

- **mat**: The input matrix
- **output_folder**: The path of the output folder
- **lower**: The lower threshold for the data if using the emptydrops function for cell calling.

Description

The feature matrix is created using a given demultiplexed BAM file and a selected feature type.

Usage

```r
sc_atac_feature_counting(
  fragment_file,
  feature_input = NULL,
  bam_tags = list(bc = "CB", mb = "OX"),
  feature_type = "peak",
  organism = "hg38",
  cell_calling = "filter",
  sample_name = "",
  genome_size = NULL,
  promoters_file = NULL,
  tss_file = NULL,
  enhs_file = NULL,
  gene_anno_file = NULL,
  pheno_data = NULL,
  bin_size = NULL,
  yieldsize = 1e+06,
  n_filter_cell_counts = 200,
  n_filter_feature_counts = 10,
  exclude_regions = FALSE,
  excluded_regions_filename = NULL,
  output_folder = NULL,
  fix_chr = "none",
  lower = NULL,
  min_uniq_frags = 3000,
  max_uniq_frags = 50000,
  min_frac_peak = 0.3,
  min_frac_tss = 0,
  min_frac_enhancer = 0,
  min_frac_promoter = 0.1,
  max_frac_mito = 0.15,
)```
create_report = FALSE

Arguments

fragment_file The fragment file
feature_input The feature input data e.g. the .narrowPeak file for peaks of a bed file format
bam_tags The BAM tags
feature_type The type of feature
organism The organism type (contains hg19, hg38, mm10)
cell_calling The desired cell calling method; either cellranger, emptydrops or filter.
sample_name The sample name to identify which is the data is analysed for.
genome_size The size of the genome (used for the cellranger cell calling method)
promoters_file The path of the promoter annotation file (if the specified organism isn’t recognised).
tss_file The path of the tss annotation file (if the specified organism isn’t recognised).
enhs_file The path of the enhs annotation file (if the specified organism isn’t recognised).
gene_anno_file The path of the gene annotation file (gtf or gff3 format).
pheno_data The phenotypic data as a data frame
bin_size The size of the bins
yieldsite The yield size
n_filter_cell_counts An integer value to filter the feature matrix on the number of reads per cell (default = 200)
n_filter_feature_counts An integer value to filter the feature matrix on the number of reads per feature (default = 10).
exclude_regions Whether or not the regions (specified in the file) should be excluded
excluded_regions_filename The filename of the file containing the regions to be excluded
output_folder The output folder
fix_chr Whether chr should be fixed or not
lower The lower threshold for the data if using the emptydrops function for cell calling
min_uniq_frags The minimum number of required unique fragments required for a cell (used for filter cell calling)
max_uniq_frags The maximum number of required unique fragments required for a cell (used for filter cell calling)
min_frac_peak The minimum proportion of fragments in a cell to overlap with a peak (used for filter cell calling)
min_frac_tss The minimum proportion of fragments in a cell to overlap with a tss (used for filter cell calling)
The minimum proportion of fragments in a cell to overlap with a enhancer sequence (used for filter cell calling)

The minimum proportion of fragments in a cell to overlap with a promoter sequence (used for filter cell calling)

The maximum proportion of fragments in a cell that are mitochondrial (used for filter cell calling)

Logical value to say whether to create the report or not (default = TRUE).

None (invisible ‘NULL’)

## Not run:
sc_atac_feature_counting(
  fragment_file = fragment_file,
  cell_calling = "filter",
  exclude_regions = TRUE,
  feature_input = feature_file)

## End(Not run)
**sc_atac_peak_calling**

**Arguments**

- **mtx** The input matrix
- **cell_qc_metrics_file** A file containing QC statistics for each cell
- **min_uniq_frags** The minimum number of required unique fragments required for a cell
- **max_uniq_frags** The maximum number of required unique fragments required for a cell
- **min_frac_peak** The minimum proportion of fragments in a cell to overlap with a peak
- **min_frac_tss** The minimum proportion of fragments in a cell to overlap with a TSS
- **min_frac_enhancer** The minimum proportion of fragments in a cell to overlap with an enhancer sequence
- **min_frac_promoter** The minimum proportion of fragments in a cell to overlap with a promoter sequence
- **max_frac_mito** The maximum proportion of fragments in a cell that are mitochondrial

**Usage**

```r
sc_atac_peak_calling(
  inbam,
  ref = NULL,
  genome_size = NULL,
  output_folder = NULL
)
```

**Arguments**

- **inbam** The input tagged, sorted, duplicate-free input BAM file
- **ref** The reference genome file
- **genome_size** The size of the genome
- **output_folder** The path of the output folder

**Value**

None (invisible ‘NULL’)
Examples

```r
## Not run:
sc_atac_peak_calling(
inbam,
reference)
## End(Not run)
```

sc_atac_pipeline  
A convenient function for running the entire pipeline

Description

A convenient function for running the entire pipeline

Usage

```r
sc_atac_pipeline(
  r1,
  r2,
  bc_file,
  valid_barcode_file = "",
  id1_st = -0,
  id1_len = 16,
  id2_st = 0,
  id2_len = 16,
  rmN = TRUE,
  rmlow = TRUE,
  organism = NULL,
  reference = NULL,
  feature_type = NULL,
  remove_duplicates = FALSE,
  samtools_path = NULL,
  genome_size = NULL,
  bin_size = NULL,
  yieldsize = 1e+06,
  exclude_regions = TRUE,
  excluded_regions_filename = NULL,
  fix_chr = "none",
  lower = NULL,
  cell_calling = "filter",
  promoters_file = NULL,
  tss_file = NULL,
  enhs_file = NULL,
  gene_anno_file = NULL,
  min_uniq_frags = 3000,
  max_uniq_frags = 50000,
)```
sc_atac_pipeline

min_frac_peak = 0.3,
min_frac_tss = 0,
minfrac_enhancer = 0,
min_frac_promoter = 0.1,
max_frac_mito = 0.15,
report = TRUE,
nthreads = 12,
output_folder = NULL
)

Arguments

r1 The first read fastq file
r2 The second read fastq file
bc_file the barcode information, can be either in a fastq format (e.g. from 10x-ATAC) or from a .csv file (here the barcode is expected to be on the second column). Currently, for the fastq approach, this can be a list of barcode files.
valid_barcode_file optional file path of the valid (expected) barcode sequences to be found in the bc_file (.txt, can be txt.gz). Must contain one barcode per line on the second column separated by a comma (default = ""). If given, each barcode from bc_file is matched against the barcode of best fit (allowing a hamming distance of 1). If a FASTQ bc_file is provided, barcodes with a higher mapping quality, as given by the fastq reads quality score are prioritised.
id1_st barcode start position (0-indexed) for read 1, which is an extra parameter that is needed if the bc_file is in a .csv format.
id1_len barcode length for read 1, which is an extra parameter that is needed if the bc_file is in a .csv format.
id2_st barcode start position (0-indexed) for read 2, which is an extra parameter that is needed if the bc_file is in a .csv format.
id2_len barcode length for read 2, which is an extra parameter that is needed if the bc_file is in a .csv format.
rmN logical, whether to remove reads that contains N in UMI or cell barcode.
rmlow logical, whether to remove reads that have low quality barcode sequences.
orGANISm The name of the organism e.g. hg38
reference The reference genome file
feature_type The feature type (either 'genome_bin' or 'peak')
remove_duplicates Whether or not to remove duplicates (samtools is required)
samtools_path A custom path of samtools to use for duplicate removal
genome_size The size of the genome (used for the cellranger cell calling method)
bin_size The size of the bins for feature counting with the 'genome_bin' feature type
yieldsize The number of reads to read in for feature counting
exclude_regions  Whether or not the regions should be excluded
excluded_regions_filename  The filename of the file containing the regions to be excluded
fix_chr  Specify 'none', 'exclude_regions', 'feature' or 'both' to prepend the string "chr" to the start of the associated file
lower  the lower threshold for the data if using the emptydrops function for cell calling.
cell_calling  The desired cell calling method either cellranger, emptydrops or filter
promoters_file  The path of the promoter annotation file (if the specified organism isn’t recognised)
tss_file  The path of the tss annotation file (if the specified organism isn’t recognised)
enh_file  The path of the enhs annotation file (if the specified organism isn’t recognised)
gene_anno_file  The path of the gene annotation file (gtf or gff3 format)
min_uniq_frags  The minimum number of required unique fragments required for a cell (used for filter cell calling)
max_uniq_frags  The maximum number of required unique fragments required for a cell (used for filter cell calling)
min_frac_peak  The minimum proportion of fragments in a cell to overlap with a peak (used for filter cell calling)
min_frac_tss  The minimum proportion of fragments in a cell to overlap with a tss (used for filter cell calling)
min_frac_enhancer  The minimum proportion of fragments in a cell to overlap with a enhancer sequence (used for filter cell calling)
min_frac_promoter  The minimum proportion of fragments in a cell to overlap with a promoter sequence (used for filter cell calling)
max_frac_mito  The maximum proportion of fragments in a cell that are mitochondrial (used for filter cell calling)
report  Whether or not a HTML report should be produced
nthreads  The number of threads to use for alignment (sc_align) and demultiplexing (sc_atac_bam_tagging)
output_folder  The path of the output folder

Value
None (invisible ‘NULL’)
# barcodes in fastq format
barcode_fastq <- file.path(data.folder, "small_chr21_R2.fastq.gz")

## Not run:
sc_atac_pipeline(
  r1 = r1,
  r2 = r2,
  bc_file = barcode_fastq
)

## End(Not run)

---

### sc_atac_pipeline_quick_test

A function that tests the pipeline on a small test sample (without duplicate removal)

#### Description

A function that tests the pipeline on a small test sample (without duplicate removal)

#### Usage

sc_atac_pipeline_quick_test()

#### Value

None (invisible ‘NULL’)

---

### sc_atac_plot_cells_per_feature

A histogram of the log-number of cells per feature

#### Description

A histogram of the log-number of cells per feature

#### Usage

sc_atac_plot_cells_per_feature(sce)

#### Arguments

sce The SingleExperimentObject produced by the sc_atac_create_sce function at the end of the pipeline
**sc_atac_plot_features_per_cell**

*A histogram of the log-number of features per cell*

**Description**

A histogram of the log-number of features per cell

**Usage**

`sc_atac_plot_features_per_cell(sce)`

**Arguments**

- **sce**
  
  The SingleExperimentObject produced by the `sc_atac_create_sce` function at the end of the pipeline

**Value**

returns NULL

---

**sc_atac_plot_features_per_cell_ordered**

*Plot showing the number of features per cell in ascending order*

**Description**

Plot showing the number of features per cell in ascending order

**Usage**

`sc_atac_plot_features_per_cell_ordered(sce)`

**Arguments**

- **sce**
  
  The SingleExperimentObject produced by the `sc_atac_create_sce` function at the end of the pipeline

**Value**

returns NULL
The document contains two sections, each describing a function:

### `sc_atac_plot_fragments_cells_per_feature`

- **Description:**
  A scatter plot of the log-number of fragments and log-number of cells per feature.

- **Usage:**
  ```r
  sc_atac_plot_fragments_cells_per_feature(sce)
  ```

- **Arguments:**
  - `sce`: The SingleExperimentObject produced by the `sc_atac_create_sce` function at the end of the pipeline.

- **Value:**
  returns NULL

### `sc_atac_plot_fragments_features_per_cell`

- **Description:**
  A scatter plot of the log-number of fragments and log-number of features per cell.

- **Usage:**
  ```r
  sc_atac_plot_fragments_features_per_cell(sce)
  ```

- **Arguments:**
  - `sce`: The SingleExperimentObject produced by the `sc_atac_create_sce` function at the end of the pipeline.

- **Value:**
  returns NULL
sc_atac_plot_fragments_per_cell

A histogram of the log-number of fragments per cell

Description
A histogram of the log-number of fragments per cell

Usage
sc_atac_plot_fragments_per_cell(sce)

Arguments
sce The SingleExperimentObject produced by the sc_atac_create_sce function at the end of the pipeline

Value
returns NULL

sc_atac_plot_fragments_per_feature

A histogram of the log-number of fragments per feature

Description
A histogram of the log-number of fragments per feature

Usage
sc_atac_plot_fragments_per_feature(sce)

Arguments
sce The SingleExperimentObject produced by the sc_atac_create_sce function at the end of the pipeline

Value
returns NULL
**sc_atac_remove_duplicates**

Removing PCR duplicates using samtools

**Description**

Takes in a BAM file and removes the PCR duplicates using the samtools markdup function. Requires samtools 1.10 or newer for statistics to be generated.

**Usage**

sc_atac_remove_duplicates(inbam, samtools_path = NULL, output_folder = NULL)

**Arguments**

- **inbam**: The tagged, sorted and duplicate-free input BAM file
- **samtools_path**: The path of the samtools executable (if a custom installation is to be specified)
- **output_folder**: The path of the output folder

**Value**

file path to a bam file created from samtools markdup

---

**sc_atac_tfidf**

generating the UMAPs for sc-ATAC-Seq preprocessed data

**Description**

Takes the binary matrix and generate a TF-IDF so the clustering can take place on the reduced dimensions.

**Usage**

sc_atac_tfidf(binary.mat, output_folder = NULL)

**Arguments**

- **binary.mat**: The final, filtered feature matrix in binary format
- **output_folder**: The path of the output folder

**Value**

None (invisible ‘NULL’)
Examples

```r
## Not run:
sc_atac_tfidf(binary.mat = final_binary_matrix)
## End(Not run)
```

**sc_atac_trim_barcode**  
*demultiplex raw single-cell ATAC-Seq fastq reads*

**Description**

Single-cell data need to be demultiplexed in order to retain the information of the cell barcodes the data belong to. Here we reformat fastq files so barcode/s (and if available the UMI sequences) are moved from the sequence into the read name. Since scATAC-Seq data are mostly paired-end, both 'r1' and 'r2' are demultiplexed in this function.

**Usage**

```r
sc_atac_trim_barcode(
  r1,
  r2,
  bc_file = NULL,
  valid_barcode_file = "",
  output_folder = "",
  umi_start = 0,
  umi_length = 0,
  umi_in = "both",
  rmN = FALSE,
  rmlow = FALSE,
  min_qual = 20,
  num_below_min = 2,
  id1_st = -0,
  id1_len = 16,
  id2_st = 0,
  id2_len = 16,
  no_reverse_complement = FALSE
)
```

**Arguments**

- **r1**: read one for pair-end reads.
- **r2**: read two for pair-end reads, NULL if single read.
- **bc_file**: the barcode information, can be either in a *fastq* format (e.g. from 10x-ATAC) or from a *csv* file (here the barcode is expected to be on the second column). Currently, for the fastq approach, this can be a list of barcode files.
valid_barcode_file
optional file path of the valid (expected) barcode sequences to be found in the bc_file (.txt, can be txt.gz). Must contain one barcode per line on the second column separated by a comma (default = " "). If given, each barcode from bc_file is matched against the barcode of best fit (allowing a hamming distance of 1). If a FASTQ bc_file is provided, barcodes with a higher mapping quality, as given by the fastq reads quality score are prioritised.

output_folder
the output dir for the demultiplexed fastq file, which will contain fastq files with reformatted barcode and UMI into the read name. Files ending in .gz will be automatically compressed.

umi_start
if available, the start position of the molecular identifier.

umi_length
if available, the start position of the molecular identifier.

umi_in
logical, whether to remove reads that contains N in UMI or cell barcode.

rmN
logical, whether to remove reads that have low quality barcode sequences

min_qual
the minimum base pair quality that is allowed (default = 20).

num_below_min
the maximum number of base pairs below the quality threshold.

id1_st
barcode start position (0-indexed) for read 1, which is an extra parameter that is needed if the bc_file is in a .csv format.

id1_len
barcode length for read 1, which is an extra parameter that is needed if the bc_file is in a .csv format.

id2_st
barcode start position (0-indexed) for read 2, which is an extra parameter that is needed if the bc_file is in a .csv format.

id2_len
barcode length for read 2, which is an extra parameter that is needed if the bc_file is in a .csv format.

no_reverse_complement
specifies if the reverse complement of the barcode sequence should be used for barcode error correction (only when barcode sequences are provided as fastq files). FALSE (default) lets the function decide whether to use reverse complement, and TRUE forces the function to use the forward barcode sequences.

Value
None (invisible 'NULL')

Examples

data.folder <- system.file("extdata", package = "scPipe", mustWork = TRUE)
r1 <- file.path(data.folder, "small_chr21_R1.fastq.gz")
r2 <- file.path(data.folder, "small_chr21_R3.fastq.gz")

# Using a barcode fastq file:

# barcodes in fastq format
textual_file <- file.path(data.folder, "small_chr21.barcode.fastq.gz")

# barcodes in csv format
barcode_csv <- file.path(data.folder, "small_chr21.barcode.csv")
sc_correct_bam_bc

Description

update the cell barcode tag in bam file with corrected barcode output to a new bam file. the function will be useful for methods that use the cell barcode information from bam file, such as ‘Demuxlet’

Usage

sc_correct_bam_bc(  
inbam,  
outbam,  
bc_anno,  
max_mis = 1,  
bam_tags = list(am = "YE", ge = "GE", bc = "BC", mb = "OX"),  
mito = "MT",  
nthreads = 1  
)

Arguments

inbam input bam file. This should be the output of sc_exon_mapping
outbam output bam file with updated cell barcode
Description

Wrapper to run sc_exon_mapping, sc_demultiplex and sc_gene_counting with a single command

Usage

sc_count_aligned_bam(inbam, outbam, annofn, bc_anno, max_mis, bam_tags, mito, nthreads)

Examples

data_dir="celseq2_demo"
barcode_annotation_fn = system.file("extdata", "barcode_anno.csv", package = "scPipe")
## Not run:
# refer to the vignettes for the complete workflow
...
sc_correct_bam_bc(file.path(data_dir, "out.map.bam"),
  file.path(data_dir, "out.map.clean.bam"),
  barcode_annotation_fn)
...
## End(Not run)
bam_tags = list(am = "Y", ge = "G", bc = "B", mb = "OX"),
bc_len = 8,
UMI_len = 6,
stnd = TRUE,
fix_chr = FALSE,
outdir,
bc_anno,
max_mis = 1,
mito = "MT",
has_UMI = TRUE,
UMI_cor = 1,
gene_fl = FALSE,
keep_mapped_bam = TRUE,
nthreads = 1
)

Arguments

inbam input aligned bam file. can have multiple files as input
outbam output bam filename
annofn single string or vector of gff3 annotation filenames, data.frame in SAF format or GRanges object containing complete gene_id metadata column.
bam_tags list defining BAM tags where mapping information is stored.
  • "am": mapping status tag
  • "ge": gene id
  • "bc": cell barcode tag
  • "mb": molecular barcode tag
bc_len total barcode length
UMI_len UMI length
stnd TRUE to perform strand specific mapping. (default: TRUE)
fix_chr TRUE to add 'chr' to chromosome names, MT to chrM. (default: FALSE)
outdir output folder
bc_anno barcode annotation, first column is cell id, second column is cell barcode sequence
max_mis maximum mismatch allowed in barcode. (default: 1)
mito mitochondrial chromosome name. This should be consistent with the chromosome names in the bam file.
has_UMI whether the protocol contains UMI (default: TRUE)
UMI_cor correct UMI sequencing error: 0 means no correction, 1 means simple correction and merge UMI with distance 1. 2 means merge on both UMI alignment position match.
gene_fl whether to remove low abundance genes. A gene is considered to have low abundance if only one copy of one UMI is associated with it.
keep_mapped_bam TRUE if feature mapped bam file should be retained.
nthreads number of threads to use. (default: 1)
## Description

Process bam file by cell barcode, output to outdir/count/[cell_id].csv. The output contains information for all reads that can be mapped to exons, including the gene id, UMI of that read and the distance to transcript end position.

## Usage

```r
sc_demultiplex(
  inbam,
  outdir,
  bc_anno,
  max_mis = 1,
  bamTags = list(am = "YE", ge = "GE", bc = "BC", mb = "OX"),
  mito = "MT",
  has_UMI = TRUE,
  nthreads = 1
)
```

## Arguments

- `inbam`: input bam file. This should be the output of `sc_exon_mapping`
- `outdir`: output folder
- `bc_anno`: barcode annotation, first column is cell id, second column is cell barcode sequence
- `max_mis`: maximum mismatch allowed in barcode. (default: 1)
- `bam_tags`: list defining BAM tags where mapping information is stored.

---

### Examples

```r
## Not run:
sc_count_aligned_bam(
  inbam = "aligned.bam",
  outbam = "mapped.bam",
  annofn = c("MusMusculus-GRCm38p4-UCSC.gff3", "ERCC92_anno.gff3"),
  outdir = "output",
  bc_anno = "barcodes.csv"
)
## End(Not run)
```
sc_demultiplex_and_count

Description

Wrapper to run `sc_demultiplex` and `sc_gene_counting` with a single command

Usage

```r
sc_demultiplex_and_count(
  inbam, 
  outdir, 
  bc_anno, 
  max_mis = 1, 
  bam_tags = list(am = "YE", ge = "GE", bc = "BC", mb = "OX"), 
  mito = "MT", 
  has_UMI = TRUE,
)```

Examples

```r
data_dir="celseq2_demo"
barcode_annotation_fn = system.file("extdata", "barcode_anno.csv", 
  package = "scPipe")

## Not run:
# refer to the vignettes for the complete workflow
...
sc_demultiplex(file.path(data_dir, "out.map.bam"),
  data_dir,
  barcode_annotation_fn, has_UMI=FALSE)
...

## End(Not run)
```
Umi_cor = 1,
gene_fl = FALSE,
nthreads = 1
)

Arguments

inbam  input bam file. This should be the output of sc_exon_mapping
outdir  output folder
bc_anno  barcode annotation, first column is cell id, second column is cell barcode se-
sequence
max_mis  maximum mismatch allowed in barcode. (default: 1)
bam_tags  list defining BAM tags where mapping information is stored.
  • "am": mapping status tag
  • "ge": gene id
  • "bc": cell barcode tag
  • "mb": molecular barcode tag
mito  mitochondrial chromosome name. This should be consistent with the chromo-
some names in the bam file.
has_UMI  whether the protocol contains UMI (default: TRUE)
UMI_cor  correct UMI sequencing error: 0 means no correction, 1 means simple correction
and merge UMI with distance 1. 2 means merge on both UMI alignment position
match.
gene_fl  whether to remove low abundance genes. A gene is considered to have low
abundance if only one copy of one UMI is associated with it.
nthreads  number of threads to use. (default: 1)

Value

no return

Examples

## Not run:
refer to the vignettes for the complete workflow, replace demultiplex and
count with single command:
...
sc_demultiplex_and_count(
  file.path(data_dir, "out.map.bam"),
data_dir,
  barcode_annotation_fn,
  has_UMI = FALSE
)
)
...

## End(Not run)
**sc_detect_bc**

### Description

Detect cell barcode and generate the barcode annotation

### Usage

```r
sc_detect_bc(
  infq,
  outcsv,
  prefix = "CELL_",
  bc_len,
  max_reads = 1e+06,
  min_count = 10,
  number_of_cells = 10000,
  max_mismatch = 1,
  white_list_file = NULL
)
```

### Arguments

- **infq**: input fastq file, should be the output file of `sc_trim_barcode`
- **outcsv**: output barcode annotation
- **prefix**: the prefix of cell name (default: 'CELL_')
- **bc_len**: the length of cell barcode, should be consistent with bl1+bl2 in `sc_trim_barcode`
- **max_reads**: the maximum of reads processed (default: 1,000,000)
- **min_count**: minimum counts to keep, barcode will be discarded if it has lower count. Default value is 10. This should be set according to `max_reads`.
- **number_of_cells**: number of cells kept in result. (default: 10000)
- **max_mismatch**: the maximum mismatch allowed. Barcodes within this number will be considered as sequence error and merged. (default: 1)
- **white_list_file**: a file that list all the possible barcodes each row is a barcode sequence. The list for 10x can be found at: https://community.10xgenomics.com/t5/Data-Sharing/List-of-valid-cellular-barcodes/td-p/527 (default: NULL)

### Value

- no return
Examples

```r
# Not run:
# `sc_detect_bc` should run before `sc_demultiplex` for
# Drop-seq or 10X protocols
sc_detect_bc("input.fastq","output.cell_index.csv",bc_len=8)
sc_demultiplex(...,"output.cell_index.csv")
```

## End(Not run)

---

### Description

Map aligned reads to exon annotation. The result will be written into optional fields in bam file with different tags. Following this link for more information regarding to bam file format: [http://samtools.github.io/hts-specs](http://samtools.github.io/hts-specs)

The function can accept multiple bam file as input, if multiple bam file is provided and the `bc_len` is zero, then the function will use the barcode in the `barcode_vector` to insert into the `bc` bam tag. So the length of `barcode_vector` and the length of `inbam` should be the same If this is the case then the `max_mis` argument in `sc_demultiplex` should be zero. If `be_len` is larger than zero, then the function will still seek for barcode in fastq headers with given length. In this case each bam file is not treated as from a single cell.

### Usage

```r
sc_exon_mapping(
  inbam,
  outbam,
  annofn,
  bam_tags = list(am = "YE", ge = "GE", bc = "BC", mb = "OX"),
  bc_len = 8,
  barcode_vector = "",
  UMI_len = 6,
  stnd = TRUE,
  fix_chr = FALSE,
  nthreads = 1
)
```

### Arguments

- **inbam**: input aligned bam file. can have multiple files as input
- **outbam**: output bam filename
- **annofn**: single string or vector of gff3 annotation filenames, data.frame in SAF format or GRanges object containing complete gene_id metadata column.
sc_gene_counting

**Description**

Generate gene counts matrix with UMI deduplication

**Usage**

```
sc_gene_counting(outdir, bc_anno, UMI_cor = 2, gene_fl = FALSE)
```
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>outdir</code></td>
<td>output folder containing <code>sc_demultiplex</code> output</td>
</tr>
<tr>
<td><code>bc_anno</code></td>
<td>barcode annotation comma-separated-values, first column is cell id, second column is cell barcode sequence</td>
</tr>
<tr>
<td><code>UMI_cor</code></td>

## End(Not run)

sc_get_umap_data Generates UMAP data from sce object

Description

Produces a DataFrame containing the UMAP dimensions, as well as all the colData of the sce object for each cell

Usage

sc_get_umap_data(sce, n_neighbours = 30)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sce</code></td>
<td>The SingleCellExperiment object</td>
</tr>
<tr>
<td><code>n_neighbours</code></td>
<td>No. of neighbours for KNN</td>
</tr>
</tbody>
</table>

Value

A dataframe containing the UMAP dimensions, as well as all the colData of the sce object for each cell
Integrate multi-omic scRNA-Seq and scATAC-Seq data into a MultiAssayExperiment

Description

Generates an integrated SCE object with scRNA-Seq and scATAC-Seq data produced by the scPipe pipelines

Usage

```r
sc_integrate(
  sce_list,
  barcode_match_file = NULL,
  sce_column_to_barcode_files = NULL,
  rev_comp = NULL,
  cell_line_info = NULL,
  output_folder = NULL
)
```

Arguments

- **sce_list**: A list of SCE objects, named with the corresponding technologies
- **barcode_match_file**: A .csv file with columns corresponding to the barcodes for each tech
- **sce_column_to_barcode_files**: A list of files containing the barcodes for each tech (if not needed then give a ‘NULL’ entry)
- **rev_comp**: A named list of technologies and logical flags specifying if reverse complements should be applied for sequences (if not needed then provide a ‘NULL’ entry)
- **cell_line_info**: A list of files, each of which contains 2 columns corresponding to the barcode and cell line for each tech (if not needed then provide a ‘NULL’ entry)
- **output_folder**: The path to the output folder

Value

Returns a MultiAssayExperiment containing the scRNA-Seq and scATAC-Seq data produced by the scPipe pipelines

Examples

```r
## Not run:
sc_integrate(
  sce_list = list("RNA" = sce.rna, "ATAC" = sce.atac),
  barcode_match_file = bc_match_file,
  sce_column_to_barcode_files = list("RNA" = rna_bc_anno, "ATAC" = NULL),
```
**sc_interactive_umap_plot**

*Produces an interactive UMAP plot via Shiny*

**Description**

Can colour the UMAP by any of the colData columns in the SCE object

**Usage**

```r
sc_interactive_umap_plot(sce)
```

**Arguments**

- `sce` The SingleCellExperiment object

**Value**

A shiny object which represents the app. Printing the object or passing it to `shiny::runApp(...)` will run the app.

---

**sc_mae_plot_umap**

*Generates UMAP of multiomic data*

**Description**

Uses feature count data from multiple experiment objects to produce UMAPs for each assay and then overlay them on the same pair of axes

**Usage**

```r
sc_mae_plot_umap(mae, by = NULL, output_file = NULL)
```

**Arguments**

- `mae` The MultiAssayExperiment object
- `by` What to colour the points by. Needs to be in colData of all experiments.
- `output_file` The path of the output file
**Value**

A ggplot2 object representing the UMAP plot

---

**sc_sample_data**

*a small sample scRNA-seq counts dataset to demonstrate capabilities of scPipe*

---

**Description**

This data set contains counts for high variable genes for 100 cells. The cells have different cell types. The data contains raw read counts. The cells are chosen randomly from 384 cells and they did not go through quality controls. The rows names are Ensembl gene ids and the columns are cell names, which is the wall position in the 384 plates.

**Format**

a matrix instance, one row per gene.

**Value**

NULL, but makes a matrix of count data

**Author(s)**

Luyi Tian

**Source**

Christin Biben (WEHI). She FACS sorted cells from several immune cell types including B cells, granulocyte and some early progenitors.

**Examples**

```r
# use the example dataset to perform quality control
data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication
sce = detect_outlier(sce)
plot_QC_pairs(sce)
```
sc_sample_qc

quality control information for a small sample scRNA-seq dataset to
demonstrate capabilities of scPipe.

Description

This data.frame contains cell quality control information for the 100 cells. For each cell it has:

- unaligned the number of unaligned reads.
- aligned_unmapped the number of reads that aligned to genome but fail to map to any features.
- mapped_to_exon is the number of reads that mapped to exon.
- mapped_to_intron is the number of reads that mapped to intron.
- ambiguous_mapping is the number of reads that mapped to multiple features. They are not
  considered in the following analysis.
- mapped_to_ERCC is the number of reads that mapped to ERCC spike-in controls.
- mapped_to_MT is the number of reads that mapped to mitochondrial genes.
- total_count_per_cell is the number of reads that mapped to exon after UMI deduplication. In
  contrast, 'mapped_to_exon' is the number of reads mapped to exon before UMI deduplication.
- number_of_genes is the number of genes detected for each cells
- non_ERCC_percent is 1 - (percentage of ERCC reads). Reads are UMI deduplicated.
- non_mt_percent is 1 - (percentage of mitochondrial reads). Reads are UMI deduplicated.
- non_ribo_percent is 1 - (percentage of ribosomal reads). Reads are UMI deduplicated.

Format

a data.frame instance, one row per cell.

Value

NULL, but makes a data frame with cell quality control data.frame

Author(s)

Luyi Tian

Source

granulocyte and some early progenitors.
Examples

data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
head(QC_metrics(sce))
plot_mapping(sce,percentage=TRUE,dataname="sc_sample")

sc_trim_barcode  sc_trim_barcode

Description

Reformat fastq files so barcode and UMI sequences are moved from the sequence into the read name.

Usage

sc_trim_barcode(
  outfq,
  r1,
  r2 = NULL,
  read_structure = list(bs1 = -1, bl1 = 0, bs2 = 6, bl2 = 8, us = 0, ul = 6),
  filter_settings = list(rmlow = TRUE, rmN = TRUE, minq = 20, numbq = 2)
)

Arguments

outfq the output fastq file, which reformat the barcode and UMI into the read name. Files ending in .gz will be automatically compressed.

r1 read one for pair-end reads. This read should contain the transcript.

r2 read two for pair-end reads, NULL if single read. (default: NULL)

read_structure a list containing the read structure configuration:
  • bs1: starting position of barcode in read one. -1 if no barcode in read one.
  • bl1: length of barcode in read one, if there is no barcode in read one this number is used for trimming beginning of read one.
  • bs2: starting position of barcode in read two
  • bl2: length of barcode in read two
  • us: starting position of UMI
  • ul: length of UMI

filter_settings A list contains read filter settings:
• rmlow whether to remove the low quality reads.
• rmN whether to remove reads that contains N in UMI or cell barcode.
• minq the minimum base pair quality that we allowed
• numbq the maximum number of base pair that have quality below numbq

Details

Positions used in this function are 0-indexed, so they start from 0 rather than 1. The default read structure in this function represents CEL-seq paired-ended reads. This contains a transcript in the first read, a UMI in the first 6bp of the second read followed by a 8bp barcode. So the read structure will be: list(bs1=-1, bl1=0, bs2=6, bl2=8, us=0, ul=6). bs1=-1, bl1=0 indicates negative start position and zero length for the barcode on read one, this is used to denote "no barcode" on read one. bs2=6, bl2=8 indicates there is a barcode in read two that starts at the 7th base with length 8bp. us=0, ul=6 indicates a UMI from first base of read two and the length in 6bp.

For a typical Drop-seq experiment the read structure will be list(bs1=-1, bl1=0, bs2=0, bl2=12, us=12, ul=8), which means the read one only contains transcript, the first 12bp in read two are cell barcode, followed by a 8bp UMI.

Value

generates a trimmed fastq file named outfq

Examples

data_dir="celseq2_demo"
## Not run:
# for the complete workflow, refer to the vignettes
...  
sc_trim_barcode(file.path(data_dir, "combined.fastq"),
                file.path(data_dir, "simu_R1.fastq"),
                file.path(data_dir, "simu_R2.fastq"))
...  
## End(Not run)

TF.IDF.custom

Description

Returns the TF-IDF normalised version of a binary matrix

Usage

TF.IDF.custom(binary.mat, verbose = TRUE)
Arguments

- binary.mat: The binary matrix
- verbose: boolean flag to print status messages

Value

Returns the TF-IDF normalised version of a binary matrix

| UMI_duplication | UMI duplication statistics for a small sample scRNA-seq dataset to demonstrate capabilities of scPipe |

Description

This data.frame contains UMI duplication statistics, where the first column is the number of duplication, and the second column is the count of UMIs.

Format

A data.frame instance, one row per cell.

Value

NULL, but makes a data frame with UMI duplication statistics

Author(s)

Luyi Tian

Source

Christin Biben (WEHI). She FACS sorted cells from several immune cell types including B cells, granulocyte and some early progenitors.

Examples

data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts =as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
QC_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication

head(UMI_dup_info(sce))
**UMI_dup_info**

Get or set UMI duplication results in a SingleCellExperiment object

---

**Description**

Get or set UMI duplication results in a SingleCellExperiment object

**Usage**

```
UMI_dup_info(object)
```

```
UMI_dup_info(object) <- value
```

```
UMI_dup_info.sce(object)
```

```
## S4 method for signature 'SingleCellExperiment'
UMI_dup_info(object)
```

```
## S4 replacement method for signature 'SingleCellExperiment'
UMI_dup_info(object) <- value
```

**Arguments**

- `object` A SingleCellExperiment object.
- `value` Value to be assigned to corresponding object.

**Value**

a dataframe of cell UMI duplication information

A DataFrame of UMI duplication results.

**Author(s)**

Luyi Tian

**Examples**

```r
data("sc_sample_data")
data("sc_sample_qc")
sce = SingleCellExperiment(assays = list(counts = as.matrix(sc_sample_data)))
organism(sce) = "mmusculus_gene_ensembl"
gene_id_type(sce) = "ensembl_gene_id"
Qc_metrics(sce) = sc_sample_qc
demultiplex_info(sce) = cell_barcode_matching
UMI_dup_info(sce) = UMI_duplication

head(UMI_dup_info(sce))
```
