Package ‘scReClassify’

March 19, 2024

Type Package
Title scReClassify: post hoc cell type classification of single-cell RNA-seq data
Version 1.8.0
Description A post hoc cell type classification tool to fine-tune cell type annotations generated by any cell type classification procedure with semi-supervised learning algorithm AdaSampling technique. The current version of scReClassify supports Support Vector Machine and Random Forest as a base classifier.

git_branch RELEASE_3_18
git_last_commit 41a576c
git_last_commit_date 2023-10-24
Repository Bioconductor 3.18
Description
This function calculates the accuracy of the prediction to the true label.

Usage
bAccuracy(cls.truth, final)

Arguments

cls.truth    A character vector of true class label.
final        A vector of final classified label prediction from multiAdaSampling.

Value
An accuracy value.

Author(s)
Pengyi Yang, Taiyun Kim

Examples

data("gse87795_subset_sce")

mat.expr <- gse87795_subset_sce
cellTypes <- gse87795_subset_sce$cellTypes

# Get dimension reduced matrix. We are using "logNorm" assay from "mat.expr".
mat.pc <- matPCs(mat.expr, assay = "logNorm")
# Here we are using Support Vector Machine as a base classifier.
result <- multiAdaSampling(mat.pc, cellTypes, classifier = "svm", percent = 1, L = 10)
final <- result$final

# Balanced accuracy
bacc <- bAccuracy(cellTypes, final)

---

**gse87795_subset_sce**  
**GSE827795 subset data**

**Description**

A `SingleCellExperiment` object containing a subset expression matrix of GSE827795. The data contains log2 transformed FPKM expression.

GSE87795 is a mouse fetal liver development data containing 1000 genes, 367 cells and 6 cell types.

The original GSE87795 data and the study details can be found at this [link](#).

**Usage**

`gse87795_subset_sce`

**Format**

An object of class `SingleCellExperiment` with 1000 rows and 367 columns.

---

**matPCs**  
**matPCs function**

**Description**

Performs PCA on a given matrix and returns a dimension reduced matrix which captures at least 80% (default) of overall variability.

**Usage**

`matPCs(data, assay = NULL, percentVar = 0.8)`
multiAdaSampling

Arguments

- **data**: An expression matrix or a SingleCellExperiment object.
- **assay**: An assay to select if data is a SingleCellExperiment object.
- **percentVar**: The percentage of variance threshold. This is used to select number of Principal Components.

Details

This function performs PCA to reduce the dimension of the gene expression matrix limited from 10 to 20 PCs.

Value

Dimensionally reduced matrix.

Author(s)

Pengyi Yang, Taiyun Kim

Examples

```r
data("gse87795_subset_sce")
mat.expr <- gse87795_subset_sce
mat.pc <- matPCs(mat.expr, assay = "logNorm")

# to capture at least 70% of overall variability in the dataset,
mat.dim.reduct.70 <- matPCs(mat.expr, assay = "logNorm", 0.7)
```

multiAdaSampling

multi Adaptive Sampling function

Description

Performs multiple adaptive sampling to train a classifier model.

Usage

```r
multiAdaSampling(
  data,
  label,
  reducedDimName = NULL,
  classifier = "svm",
  percent = 1,
  L = 10,
)```
multiAdaSampling

    prob = FALSE,
    balance = TRUE,
    iter = 3
  )

Arguments

data     A dimension reduced matrix from matPCs.
label    A named vector of label information for each sample. The names should match
          the sample names of data
reducedDimName A name of the reducedDim to use. This must be specified if data is a Single-
               CellExperiment object.
classifier Base classifier model, either "SVM" (svm) or "RF" 'rf' is supported.
percent   Percentage of samples to select at each iteration.
L         Number of ensembles. Default to 10.
prob      logical flag to return sample's probabilities to each class.
balance   logical flag to if the cell types are balanced. If FALSE, down sample large cell
          types classes to the median of all class sizes.
iter      A number of iterations to perform adaSampling.

Value

A final prediction, probabilities for each cell type and the model are returned as a list.

Author(s)

Pengyi Yang, Taiyun Kim

Examples

library(SingleCellExperiment)

# Loading the data
data("gse87795_subset_sce")

mat.expr <- gse87795_subset_sce
cellTypes <- gse87795_subset_sce$cellTypes

# Get dimension reduced matrix. We are using `logNorm` assay from `mat.expr`
reducedDim(mat.expr, "matPCs") <- matPCs(mat.expr, assay = "logNorm")

# Here we are using Support Vector Machine as a base classifier.
result <- multiAdaSampling(mat.expr, cellTypes, reducedDimName = "matPCs",
                          classifier = "svm", percent = 1, L = 10)
**scReClassify**

*scReClassify: a package for post hoc cell type classification of single-cell RNA-sequencing data.*

---

**Description**

A post hoc cell type classification tool to fine-tune cell type annotations generated by any cell type classification procedure with semi-supervised learning algorithm AdaSampling technique.

The current version of scReClassify supports Support Vector Machine and Random Forest as a base classifier.
