Package ‘BioPlex’

June 18, 2024

Title R-side access to BioPlex protein-protein interaction data

Version 1.10.0

Description The BioPlex package implements access to the BioPlex protein-protein interaction networks and related resources from within R.
Besides protein-protein interaction networks for HEK293 and HCT116 cells, this includes access to CORUM protein complex data, and transcriptome and proteome data for the two cell lines.
Functionality focuses on importing the various data resources and storing them in dedicated Bioconductor data structures, as a foundation for integrative downstream analysis of the data.

**annotatePFAM**

Annotate PFAM domains to BioPlex PPI graph

Description

This function adds PFAM domain annotations to the node metadata of the BioPlex PPI graph.

Usage

`annotatePFAM(bp.gr, orgdb)`

Arguments

- `bp.gr` an object of class `graph` storing the BioPlex PPIs. Typically obtained via `bioplex2graph`.
- `orgdb` an `orgdb` object storing annotation data for human.

Value

An object of class `graphNEL` containing PFAM domain annotations in the `nodeData`.

PFAM: http://pfam.xfam.org

See Also

nodeData

Examples

# (1) Obtain the latest version of the 293T PPI network
bp.293t <- getBioPlex(cell.line = "293T", version = "3.0")

# (2) Turn the data into a graph
bp.gr <- bioplex2graph(bp.293t)

# (3) Obtain orgdb package from AnnotationHub
ah <- AnnotationHub::AnnotationHub()
orgdb <- AnnotationHub::query(ah, c("orgDb", "Homo sapiens"))
orgdb <- orgdb[[1]]

# (4) Annotate PFAM domains
bp.gr <- annotatePFAM(bp.gr, orgdb)

bioplex2graph Representation of BioPlex PPIs in a graph data structure

Description

Representation of BioPlex PPIs in a graphNEL object from the graph package.

Usage

bioplex2graph(bioplex.df)

Arguments

bioplex.df a data.frame storing the Bioplex PPIs in a flat from-to format. Typically obtained via getBioPlex.

Value

An object of class graphNEL.

References

BioPlex: https://bioplex.hms.harvard.edu/interactions.php
ccleProteome2SummarizedExperiment

See Also

getBioPlex, ftM2graphNEL

Examples

# (1) Obtain the latest version of the 293T PPI network
bp.293t <- getBioPlex(cell.line = "293T", version = "3.0")

# (2) Turn the data into a graph
bp.gr <- bioplex2graph(bp.293t)

description

Functionality for storing the protein expression data from the Cancer Cell Line Encyclopedia (CCLE) in a SummarizedExperiment.

Usage

ccleProteome2SummarizedExperiment(df, cell.line = "HCT116")

Arguments

df a data.frame storing the CCLE protein expression data with one measurement in each row. Typically obtained from ExperimentHub. See examples.

cell.line character. One or more cell line IDs such as "HCT116" (human colon cancer cell line 116). Use NULL to not subset by cell line. Defaults to "HCT116", which will then subset the df to measurements for HCT116 only.

Value

A SummarizedExperiment storing protein expression data for the specified cell line(s).

References

CCLE proteomics: https://gygi.hms.harvard.edu/publications/ccle.html
corum2graphlist

Examples

# Connect to ExperimentHub
eh <- ExperimentHub:::ExperimentHub()

# Obtain CCLE proteome data frame
AnnotationHub::query(eh, c("gygi", "depmap"))
ccle.prot <- eh[["EH3459"]]
ccle.prot <- as.data.frame(ccle.prot)

# Turn into a SummarizedExperiment
se <- ccleProteome2SummarizedExperiment(ccle.prot)

corum2graphlist

Represent CORUM protein complex data as a list of graph instances

Description

Functionality for storing CORUM protein complex data in a list of graph instances.

Usage

corum2graphlist(corum.df, subunit.id.type = c("UNIPROT", "ENTREZID"))

Arguments

corum.df A data.frame storing the CORUM protein complex data. Typically obtained via getCorum.
subunit.id.type character. Supported options include "UNIPROT" (default) and "ENTREZID".

Value

A list with an entry for each complex. Each entry is an object of class graphNEL connecting all subunit IDs with each other by undirected edges.

References

CORUM: http://mips.helmholtz-muenchen.de/corum/#download

Examples

# (1) Obtain the core set of CORUM complexes ...
core <- getCorum(set = "core")

# (2) ... turn into a list of graphs
core.glist <- corum2graphlist(core)
corum2list  
Represent CORUM protein complex data as a simple list

Description

Functionality for storing CORUM protein complex data in a list.

Usage

corum2list(corum.df, subunit.id.type = c("UNIPROT", "ENTREZID"))

Arguments

corum.df       A data.frame storing the CORUM protein complex data. Typically obtained via \texttt{getCorum}.
subunit.id.type character. Supported options include "UNIPROT" (default) and "ENTREZID".

Value

A list with an entry for each complex. Each entry is a character vector of subunit IDs.

References

CORUM: \url{http://mips.helmholtz-muenchen.de/corum/#download}

Examples

# (1) Obtain the core set of CORUM complexes ...  
core <- getCorum(set = "core")

# (2) ... turn into a list  
core.list <- corum2list(core)

getBioPlex  
Obtain BioPlex protein-protein interaction data

Description

Functionality for retrieving the BioPlex protein-protein interaction data. Available networks include:

- BioPlex 293T cells (versions 1.0, 2.0, and 3.0),
- BioPlex HCT116 cells (version 1.0).

See references.
Usage

getBioPlex(
    cell.line = c("293T", "HCT116"),
    version = c("3.0", "1.0", "2.0"),
    remap.uniprot.ids = FALSE,
    cache = TRUE
)

Arguments

cell.line character. Valid options include:

- "293T": derivative of human embryonic kidney 293 cell line,
- "HCT116": human colon cancer cell line 116.

Defaults to "293T".

version character. Valid options include "1.0", "2.0", and "3.0" for 293T cells. For HCT116 cells, only "1.0" is available. Defaults to "3.0".

remap.uniprot.ids logical. Should the protein-to-gene mappings from BioPlex (i.e. UNIPROT-to-SYMBOL and UNIPROT-to-ENTREZID) be updated using Bioc annotation functionality? Defaults to FALSE which will then keep the mappings provided by BioPlex.

cache logical. Should a locally cached version used if available? Defaults to TRUE.

Value

A data.frame.

References

BioPlex: https://bioplex.hms.harvard.edu/interactions.php

Examples

# (1) Obtain the latest version of the 293T PPI network
bp.293t <- getBioPlex(cell.line = "293T", version = "3.0")

# (2) Obtain the latest version of the HCT116 PPI network
bp.hct116 <- getBioPlex(cell.line = "HCT116", version = "1.0")
getBioplexProteome  

Obtain BioPlex3 proteome data

Description

Functionality for retrieving the BioPlex3 protein expression data comparing expression in the HCT116 and the 293T cell lines.

Usage

getBioplexProteome(cache = TRUE)

Arguments

  cache  logical. Should a locally cached version used if available? Defaults to TRUE.

Value

A SummarizedExperiment storing protein expression data for the both cell line(s) with 5 replicates each.

References

BioPlex: https://bioplex.hms.harvard.edu

Examples

se <- getBioplexProteome()

getCorum  

Obtain CORUM protein complex data

Description

Functionality for retrieving the CORUM protein complex data. Available complex collections include:

- complete set of complexes,
- core set of complexes,
- complexes with splice variants.

See references.
getCorum

Usage

getCorum(
  set = c("all", "core", "splice"),
  organism = "Human",
  remap.uniprot.ids = FALSE,
  cache = TRUE,
  mode = c("ehub", "web")
)

Arguments

set character. Valid options include:
  • "all": complete set of complexes,
  • "core": core set of complexes,
  • "splice": complexes with splice variants.
  Defaults to "all".

organism character. Use NULL to not subset by organism. Defaults to "Human" which restricts the data to human protein complexes only.

remp.uniprot.ids logical. Should the protein-to-gene mappings from CORUM (i.e. UNIPROT-to-SYMBOL and UNIPROT-to-ENTREZID) be updated using Bioc annotation functionality? Currently only supported in combination with organism = "Human". Defaults to FALSE which will then keep the mappings provided by CORUM.

cache logical. Should a locally cached version used if available? Defaults to TRUE.

mode character. Should CORUM complexes be obtained from ExperimentHub or via a web download from the CORUM homepage? Defaults to "ehub", which will obtain the chosen complex set from ExperimentHub.

Value

A data.frame.

References

CORUM: http://mips.helmholtz-muenchen.de/corum/#download

Examples

# Obtain the core set of CORUM complexes
core <- getCorum(set = "core")
getGSE122425  Convenient access to 293T transcriptome data from GEO

Description
Functionality for storing the 293T RNA-seq data from GSE122425 in a SummarizedExperiment. The dataset includes three wild type samples and three NSUN2 knockout samples.

Usage
getGSE122425(cache = TRUE)

Arguments
- cache: logical. Should a locally cached version used if available? Defaults to TRUE.

Value
A SummarizedExperiment storing RNA-seq data for the 293T cell line.

References

Examples
```r
# Obtain the data as a SummarizedExperiment
se <- getGSE122425()
```

getHEK293GenomeTrack  Obtain HEK293 genome data

Description
Functionality for retrieving genomic data for different lineages of the human embryonic kidney HEK293 cell line. Returned genomic coordinates are based on the hg18 human genome assembly. See references.

Usage
getHEK293GenomeTrack(
  track = c("cnv.hmm", "cnv.snp"),
  cell.line = "293T",
  cache = TRUE
)

hasSubunit

Identify CORUM complexes that have a subunit of interest

Description

Screens a list of graph instances storing CORUM protein complex data for a subunit of choice.

Usage

hasSubunit(glist, subunit, id.type = "SYMBOL")

Arguments

glist A list of graphs storing CORUM complexes. Typically obtained via corum2graphlist.
subunit character. A gene ID corresponding to the subunit of interest.
id.type character. Gene ID type of the given subunit. Defaults to "SYMBOL".

Value

A logical vector indicating which graphs have a node with the given subunit.
Examples

# (1) Obtain the core set of CORUM complexes ...
core <- getCorum(set = "core")

# (2) ... turn into a list of graphs ...
core.glist <- corum2graphlist(core)

# (3) .. check for a particular subunit of interest
has.cdk2 <- hasSubunit(core.glist, subunit = "CDK2")

mapSummarizedExperimentOntoGraph

Map experimental data onto a graph

Description

Functionality for mapping experimental data stored in a SummarizedExperiment onto a graph object.

Usage

mapSummarizedExperimentOntoGraph(
  gr, 
  se, 
  col.names = NULL, 
  rowdata.cols = NULL, 
  prefix = ""
)

Arguments

gr an object of class graph.

se an object of class SummarizedExperiment.

col.names character. Column names of se for which assay data should be mapped onto the nodes of gr. Defaults to NULL which will then use all column names of se.

rowdata.cols character. Column names of rowData(se) which should be mapped onto the nodes of gr. Defaults to NULL which will then use all column names of rowData(se).

prefix character. Informative prefix that should be pasted together with the selected col.names and rowdata.cols to allow easy identification of columns of interest when mapping from multiple experimental datasets.

Value

An object of class graph.
Examples

# (1) Obtain the latest version of the 293T PPI network ...
bp.293t <- getBioPlex(cell.line = "293T", version = "3.0")

# (2) ... and turn into a graph
bp.gr <- bioplex2graph(bp.293t)

# (3) Obtain the BioPlex3 proteome data ...
se <- getBioplexProteome()

# (4) ... and map onto the graph
bp.gr <- mapSummarizedExperimentOntoGraph(bp.gr, se)
