Package ‘breastCancerUPP’

April 2, 2024

Type Package
Title Gene expression dataset published by Miller et al. [2005] (UPP).
Version 1.40.0
Date 2011-02-10
Description Gene expression data from a breast cancer study published by Miller et al. in 2005, provided as an eSet.
biocViews ExperimentData, CancerData, BreastCancerData, MicroarrayData, GEO
Author Markus Schroeder, Benjamin Haibe-Kains, Aedin Culhane, Christos Sotiriou, Gianluca Bontempi, John Quackenbush
Maintainer Markus Schroeder <mschroed@jimmy.harvard.edu>, Benjamin Haibe-Kains <bhaibeka@jimmy.harvard.edu>
Depends R (>= 2.5.0)
Suggests survcomp, genefu, Biobase
LazyLoad yes
License Artistic-2.0

Description

This dataset contains the gene expression, annotations and clinical data as published in Miller et al. 2005.

Usage

data(upp)

Format

ExpressionSet with 44928 features and 251 samples, containing:

- exprs(upp): Matrix containing gene expressions as measured by Affymetrix hgu133a/hgu133b technology (single-channel, oligonucleotides).
- fData(upp): AnnotatedDataFrame containing annotations of Affy microarray platform hgu133a and hgu133b.
- pData(upp): AnnotatedDataFrame containing Clinical information of the breast cancer patients whose tumors were hybridized.
- experimentalData(upp): MIAME object containing information about the dataset.
- annotation(upp): Name of the affy chip.

Details

This dataset represent the study published by Miller et al. 2005.

- Abstract: Perturbations of the p53 pathway are associated with more aggressive and therapeutically refractory tumors. However, molecular assessment of p53 status, by using sequence analysis and immunohistochemistry, are incomplete assessors of p53 functional effects. We posited that the transcriptional fingerprint is a more definitive downstream indicator of p53 function. Herein, we analyzed transcript profiles of 251 p53-sequenced primary breast tumors and identified a clinically embedded 32-gene expression signature that distinguishes p53-mutant and wild-type tumors of different histologies and outperforms sequence-based assessments of p53 in predicting prognosis and therapeutic response. Moreover, the p53 signature identified a subset of aggressive tumors absent of sequence mutations in p53 yet exhibiting expression characteristics consistent with p53 deficiency because of attenuated p53 transcript levels. Our results show the primary importance of p53 functional status in predicting clinical breast cancer behavior.
