Package ‘tissueTreg’

May 9, 2024

Title  TWGBS and RNA-seq data from tissue T regulatory cells from mice
Version  1.24.0
Author  Charles Imbusch [aut, cre],
        Michael Delacher [aut],
        Markus Feuerer [aut],
        Benedikt Brors [aut]
Maintainer  Charles Imbusch <c.imbusch@dkfz.de>
Description  The package provides ready to use epigenomes (obtained from TWGBS) and transcriptomes (RNA-seq) from various tissues as obtained in the study (Delacher and Imbusch 2017, PMID: 28783152).
Regulatory T cells (Treg cells) perform two distinct functions: they maintain self-tolerance, and they support organ homeostasis by differentiating into specialized tissue Treg cells. The underlying dataset characterises the epigenetic and transcriptomic modifications for specialized tissue Treg cells.
Depends  R (>= 3.5)
License  GPL (>= 2)
Encoding  UTF-8
LazyData  true
Suggests  BiocStyle, knitr, rmarkdown, testthat, ExperimentHub, bsseq, SummarizedExperiment, ggplot2, reshape2
VignetteBuilder  knitr
biocViews  ExperimentData, Tissue, Mus_musculus_Data, SequencingData, RNASeqData

Description

The package provides ready to use epigenomes (obtained from TWGBS) and transcriptomes (RNA-seq) from various tissues. Regulatory T cells (Treg cells) perform two distinct functions: they maintain self-tolerance, and they support organ homeostasis by differentiating into specialized tissue Treg cells. The underlying dataset characterises the epigenetic and transcriptomic modifications for specialized tissue Treg cells.

Source

Examples

    eh <- ExperimentHub::ExperimentHub()

    # RNA-seq RPKM data:
    se_rpkms <- eh[["EH1074"]]

    # Whole genome bisulfite sequencing data as bsseq objects:
    tregs_per_sample <- eh[["EH1072"]]
    tregs_per_tissue <- eh[["EH1073"]]
